First we import some formatting...

...okay, that's better, from now on any commentary written inside this Calibration.m wrapper will present as blue text (i.e. this text is not part of PSALter, it is just a use-case). Next we load the PSALter package:

Now we set up the general Lagrangian:

$$\begin{aligned}
 & -\lambda_{\cdot} \mathcal{R}^{ij}{}_{ij} + \left(\frac{r_{\cdot 1}}{3} + \frac{r_{\cdot 2}}{6} \right) \mathcal{R}_{ijhl} \mathcal{R}^{ijhl} + \left(\frac{2r_{\cdot 1}}{3} - \frac{2r_{\cdot 2}}{3} \right) \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} + \\
 & \left(\frac{r_{\cdot 4} + r_{\cdot 5}}{4} \right) \mathcal{R}_i{}^l{}_{jl} \mathcal{R}^{ihj}{}_h + \left(\frac{r_{\cdot 4} - r_{\cdot 5}}{4} \right) \mathcal{R}^{ihj}{}_h \mathcal{R}_j{}^l{}_{il} + \left(\frac{r_{\cdot 1}}{3} + \frac{r_{\cdot 2}}{6} - r_{\cdot 3} \right) \mathcal{R}^{ijhl} \mathcal{R}_{hlij} + \\
 & \left(\frac{\lambda_{\cdot}}{4} + \frac{t_{\cdot 1}}{3} + \frac{t_{\cdot 2}}{12} \right) \mathcal{T}_{ijh} \mathcal{T}^{ijh} + \left(-\frac{\lambda_{\cdot}}{2} - \frac{t_{\cdot 1}}{3} + \frac{t_{\cdot 2}}{6} \right) \mathcal{T}^{ijh} \mathcal{T}_{jhi} + \left(-\lambda_{\cdot} - \frac{t_{\cdot 1}}{3} + \frac{2t_{\cdot 3}}{3} \right) \mathcal{T}_i{}^{ji} \mathcal{T}_{hj}{}^h
 \end{aligned}$$

We also knock up some simple tools to linearise the Lagrangian:

```
** DefConstantSymbol: Defining constant symbol PerturbativeParameter.
```

We are now ready to check that PSALTer is getting the
physics right by running it on the 58 theories in arXiv:1910.14197.

Performing the survey

Case 1

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 1 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\begin{aligned} & \frac{1}{6} \dot{r}_2 \mathcal{R}_{ijhl} \mathcal{R}^{ijhl} - \frac{2}{3} \dot{r}_2 \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} + \left(\frac{\dot{r}_3}{2} + \dot{r}_5 \right) \mathcal{R}^{ijh} \mathcal{R}^l{}_{jhl} + \\ & \frac{1}{6} \left(\dot{r}_2 - 6\dot{r}_3 \right) \mathcal{R}^{ijhl} \mathcal{R}_{hl ij} + \frac{1}{2} \left(\dot{r}_3 - 2\dot{r}_5 \right) \mathcal{R}^{ijh} \mathcal{R}^l{}_{hjl} + \frac{1}{12} \dot{t}_2 \mathcal{T}_{ijh} \mathcal{T}^{ijh} - \frac{1}{6} \dot{t}_2 \mathcal{T}^{ijh} \mathcal{T}_{jih} \end{aligned}$$

To use PSALTer, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned} & \frac{1}{3} \dot{t}_2 \mathcal{A}_{aa'i} \mathcal{A}^{aa'i} - \frac{2}{3} \dot{t}_2 \mathcal{A}_{aia'} \mathcal{A}^{aa'i} + \left(-\frac{\dot{r}_3}{2} + \dot{r}_5 \right) \partial_a \mathcal{A}_i{}^j \partial^i \mathcal{A}^{aa'}{}_a + \\ & \left(-\frac{\dot{r}_3}{2} - \dot{r}_5 \right) \partial_a \mathcal{A}_i{}^j \partial^i \mathcal{A}^{aa'}{}_a - \frac{2}{3} \dot{t}_2 \mathcal{A}_{aa'i} \partial^i \mathcal{A}^{aa'} + \frac{2}{3} \dot{t}_2 \mathcal{A}_{aia'} \partial^i \mathcal{A}^{aa'} - \frac{2}{3} \dot{t}_2 \mathcal{A}_{a'ia} \partial^i \mathcal{A}^{aa'} + \\ & \frac{1}{3} \dot{t}_2 \partial_a f_{a'i} \partial^i \mathcal{A}^{aa'} - \frac{1}{6} \dot{t}_2 \partial_a f_{ia'} \partial^i \mathcal{A}^{aa'} - \frac{1}{6} \dot{t}_2 \partial_a f_{a'i} \partial^i \mathcal{A}^{aa'} + \frac{1}{6} \dot{t}_2 \partial_a f_{aa'} \partial^i \mathcal{A}^{aa'} - \frac{1}{6} \dot{t}_2 \partial_a f_{a'a} \partial^i \mathcal{A}^{aa'} + \\ & \left(-\frac{\dot{r}_3}{2} - \dot{r}_5 \right) \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_a{}^j{}_i + \left(\dot{r}_3 + 2\dot{r}_5 \right) \partial^i \mathcal{A}^{aa'}{}_a \partial_i \mathcal{A}_a{}^j{}_i + \left(-\frac{\dot{r}_3}{2} + \dot{r}_5 \right) \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_i{}^j{}_a + \\ & \left(\dot{r}_3 - 2\dot{r}_5 \right) \partial^i \mathcal{A}^{aa'}{}_a \partial_i \mathcal{A}_i{}^j{}_a + \frac{4}{3} \dot{r}_2 \partial_a \mathcal{A}_{a ij} \partial^i \mathcal{A}^{aa'i} - \frac{2}{3} \dot{r}_2 \partial_a \mathcal{A}_{a ji} \partial^i \mathcal{A}^{aa'i} + \\ & \frac{2}{3} \left(\dot{r}_2 - 6\dot{r}_3 \right) \partial_a \mathcal{A}_{ij a} \partial^i \mathcal{A}^{aa'i} - \frac{1}{3} \dot{r}_2 \partial_i \mathcal{A}_{aa' j} \partial^i \mathcal{A}^{aa'i} + \frac{1}{3} \dot{r}_2 \partial_i \mathcal{A}_{aa' i} \partial^i \mathcal{A}^{aa'i} - \frac{2}{3} \dot{r}_2 \partial_i \mathcal{A}_{aia'} \partial^i \mathcal{A}^{aa'i} \end{aligned}$$

Now we pass this theory into the PSALTer package, which computes the particle spectrum:

The (possibly singular) a -matrices associated with

the Lagrangian, as defined below Eq. (18) of arXiv:1812.02675:

$$\begin{aligned} & \left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \left(k^2 \dot{r}_2 + \dot{t}_2 \right), \begin{pmatrix} \frac{k^2 \dot{t}_2}{3} & \frac{1}{3} i \sqrt{2} k \dot{t}_2 & \frac{i k \dot{t}_2}{3} \\ -\frac{1}{3} i \sqrt{2} k \dot{t}_2 & \frac{1}{2} \left(2 k^2 \left(2 \dot{r}_3 + \dot{r}_5 \right) + \frac{4 \dot{t}_2}{3} \right) & \frac{\sqrt{2} \dot{t}_2}{3} \\ -\frac{1}{3} i k \dot{t}_2 & \frac{\sqrt{2} \dot{t}_2}{3} & \frac{\dot{t}_2}{3} \end{pmatrix}, \right. \\ & \left. \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & \frac{1}{2} k^2 \left(\dot{r}_3 + 2 \dot{r}_5 \right) & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & -\frac{3 k^2 \dot{r}_3}{2} \end{pmatrix}, (\emptyset) \right\} \end{aligned}$$

Gauge constraints on source currents:

$$\begin{aligned} & \{ \overset{0}{\tau}{}^{\perp\perp} = 0, \overset{0}{\sigma}{}^{\parallel\parallel} = 0, \overset{0}{\tau}{}^{\parallel\parallel} = 0, -i \overset{1}{\tau}{}^{\parallel\parallel}{}^{ab} = k \overset{1}{\sigma}{}^{\perp\perp}{}^{ab}, \\ & \overset{1}{\sigma}{}^{\perp\perp}{}^a = 0, \overset{1}{\tau}{}^{\perp\perp}{}^a = 0, \overset{1}{\tau}{}^{\parallel\parallel}{}^a = 0, \overset{2}{\tau}{}^{\parallel\parallel}{}^{ab} = 0, \overset{2}{\sigma}{}^{\parallel\parallel}{}^{abc} = 0 \} \end{aligned}$$

The Drazin (Moore–Penrose) inverses of these a -matrices, which are functionally analogous to the inverse b -matrices described below Eq. (21) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \left(\frac{1}{k^2 r_{\dot{2}} + t_{\dot{2}}} \right), \begin{pmatrix} \frac{3k^2(2r_{\dot{3}} + r_{\dot{5}}) + 2t_{\dot{2}}}{(1+k^2)^2(2r_{\dot{3}} + r_{\dot{5}})t_{\dot{2}}} & -\frac{i\sqrt{2}}{k(1+k^2)(2r_{\dot{3}} + r_{\dot{5}})} & \frac{i(3k^2(2r_{\dot{3}} + r_{\dot{5}}) + 2t_{\dot{2}})}{k(1+k^2)^2(2r_{\dot{3}} + r_{\dot{5}})t_{\dot{2}}} \\ \frac{i\sqrt{2}}{k(1+k^2)(2r_{\dot{3}} + r_{\dot{5}})} & \frac{1}{k^2(2r_{\dot{3}} + r_{\dot{5}})} & -\frac{\sqrt{2}}{k^2(1+k^2)(2r_{\dot{3}} + r_{\dot{5}})} \\ -\frac{i(3k^2(2r_{\dot{3}} + r_{\dot{5}}) + 2t_{\dot{2}})}{k(1+k^2)^2(2r_{\dot{3}} + r_{\dot{5}})t_{\dot{2}}} & -\frac{\sqrt{2}}{k^2(1+k^2)(2r_{\dot{3}} + r_{\dot{5}})} & \frac{3k^2(2r_{\dot{3}} + r_{\dot{5}}) + 2t_{\dot{2}}}{(k+k^3)^2(2r_{\dot{3}} + r_{\dot{5}})t_{\dot{2}}} \end{pmatrix}, \right.$$

$$\left. \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & \frac{2}{k^2(r_{\dot{3}} + 2r_{\dot{5}})} & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \left(\begin{pmatrix} 0 & 0 \\ 0 & -\frac{2}{3k^2 r_{\dot{3}}} \end{pmatrix}, (0) \right) \right\}$$

Square masses:

$$\{\emptyset, \left\{ -\frac{t_{\dot{2}}}{r_{\dot{2}}} \right\}, \emptyset, \emptyset, \emptyset, \emptyset\}$$

Massive pole residues:

$$\{\emptyset, \left\{ -\frac{1}{r_{\dot{2}}} \right\}, \emptyset, \emptyset, \emptyset, \emptyset\}$$

Massless eigenvalues:

$$\left\{ -\frac{45r_{\dot{3}}^2 + 20r_{\dot{3}}r_{\dot{5}} + 4r_{\dot{5}}^2}{r_{\dot{3}}(2r_{\dot{3}} + r_{\dot{5}})(r_{\dot{3}} + 2r_{\dot{5}})}, -\frac{45r_{\dot{3}}^2 + 20r_{\dot{3}}r_{\dot{5}} + 4r_{\dot{5}}^2}{r_{\dot{3}}(2r_{\dot{3}} + r_{\dot{5}})(r_{\dot{3}} + 2r_{\dot{5}})} \right\}$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ -\frac{1}{r_{\dot{2}}}, 0^-, -\frac{t_{\dot{2}}}{r_{\dot{2}}} \right\}, \left\{ -\frac{45r_{\dot{3}}^2 + 20r_{\dot{3}}r_{\dot{5}} + 4r_{\dot{5}}^2}{r_{\dot{3}}(2r_{\dot{3}} + r_{\dot{5}})(r_{\dot{3}} + 2r_{\dot{5}})} \right\} \right\}$$

Overall unitarity conditions:

$$\left(r_{\dot{2}} < 0 \ \&\& \ r_{\dot{3}} < 0 \ \&\& \ r_{\dot{5}} < -\frac{r_{\dot{3}}}{2} \ \&\& \ t_{\dot{2}} > 0 \right) \parallel \left(r_{\dot{2}} < 0 \ \&\& \ r_{\dot{3}} > 0 \ \&\& \ -2r_{\dot{3}} < r_{\dot{5}} < -\frac{r_{\dot{3}}}{2} \ \&\& \ t_{\dot{2}} > 0 \right)$$

So, that's the end of the PSALTER output for this theory. You can check the particle content against TABLE IV. in arXiv:1910.14197. If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$\left(r_{\dot{2}} < 0 \ \&\& \ r_{\dot{3}} < 0 \ \&\& \ r_{\dot{5}} < -\frac{r_{\dot{3}}}{2} \ \&\& \ t_{\dot{2}} > 0 \right) \parallel$$

$$\left(r_{\dot{2}} < 0 \ \&\& \ r_{\dot{3}} < 0 \ \&\& \ r_{\dot{5}} > -2r_{\dot{3}} \ \&\& \ t_{\dot{2}} > 0 \right) \parallel \left(r_{\dot{2}} < 0 \ \&\& \ r_{\dot{3}} > 0 \ \&\& \ -2r_{\dot{3}} < r_{\dot{5}} < -\frac{r_{\dot{3}}}{2} \ \&\& \ t_{\dot{2}} > 0 \right)$$

Okay, that concludes the analysis of this theory.

Case 2

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 2 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\frac{1}{6} r_{\dot{2}} \mathcal{R}_{ijkl} \mathcal{R}^{ijkl} - \frac{2}{3} r_{\dot{2}} \mathcal{R}_{ihjl} \mathcal{R}^{ijkl} + \left(\frac{r_{\dot{3}}}{2} + r_{\dot{5}} \right) \mathcal{R}^{ijh}{}_{i} \mathcal{R}^l{}_{jhl} + \frac{1}{6} \left(r_{\dot{2}} - 6r_{\dot{3}} \right) \mathcal{R}^{ijkl} \mathcal{R}_{hlij} +$$

$$\frac{1}{2} \left(r_{\dot{3}} - 2r_{\dot{5}} \right) \mathcal{R}^{ijh}{}_{i} \mathcal{R}^l{}_{hjl} + \frac{1}{12} t_{\dot{2}} \mathcal{T}_{ijh} \mathcal{T}^{ijh} - \frac{1}{6} t_{\dot{2}} \mathcal{T}^{ijh} \mathcal{T}_{jih} - \frac{2}{3} t_{\dot{3}} \mathcal{T}^i{}_{i}{}^j{}_{j} \mathcal{T}^h{}_{h}{}_{j}$$

To use PSALTer, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\frac{1}{3} t_{\dot{2}} \mathcal{A}_{aa'i} \mathcal{A}^{aa'i} - \frac{2}{3} t_{\dot{2}} \mathcal{A}_{aia'} \mathcal{A}^{aa'i} - \frac{2}{3} t_{\dot{3}} \mathcal{A}^{aa'}{}_{a} \mathcal{A}_{a'}{}^i{}_{i} + \frac{4}{3} t_{\dot{3}} \mathcal{A}_{a'}{}^i{}_{i} \partial_a f^{aa'} - \frac{4}{3} t_{\dot{3}} \mathcal{A}_{a'}{}^i{}_{i} \partial^{a'} f^a{}_a +$$

$$\frac{2}{3} t_{\dot{3}} \partial_a f^i{}_{i} \partial^{a'} f^a{}_a + \frac{2}{3} t_{\dot{3}} \partial_a f^{aa'} \partial f^i{}_{i}{}_{a'} - \frac{4}{3} t_{\dot{3}} \partial^{a'} f^a{}_a \partial f^i{}_{i}{}_{a'} + \left(-\frac{r_{\dot{3}}}{2} + r_{\dot{5}} \right) \partial_a \mathcal{A}_{i'}{}^j \partial^i \mathcal{A}^{aa'}{}_{a} +$$

$$\left(-\frac{r_{\dot{3}}}{2} - r_{\dot{5}} \right) \partial_i \mathcal{A}_{a'}{}^j \partial^i \mathcal{A}^{aa'}{}_{a} - \frac{2}{3} t_{\dot{2}} \mathcal{A}_{aa'i} \partial f^{aa'} + \frac{2}{3} t_{\dot{2}} \mathcal{A}_{aia'} \partial f^{aa'} - \frac{2}{3} t_{\dot{2}} \mathcal{A}_{a'}{}^i{}_{i} \partial f^{aa'} +$$

$$\frac{1}{3} t_{\dot{2}} \partial_a f_{a'}{}^i \partial f^{aa'} - \frac{1}{6} t_{\dot{2}} \partial_a f_{ia'} \partial f^{aa'} - \frac{1}{6} t_{\dot{2}} \partial_a f_{a'i} \partial f^{aa'} + \frac{1}{6} t_{\dot{2}} \partial_a f_{aa'} \partial f^{aa'} - \frac{1}{6} t_{\dot{2}} \partial_a f_{a'a} \partial f^{aa'} +$$

$$\left(-\frac{r_{\dot{3}}}{2} - r_{\dot{5}} \right) \partial_a \mathcal{A}^{aa'}{}_{i} \partial_i \mathcal{A}_{a'}{}^j + \left(r_{\dot{3}} + 2r_{\dot{5}} \right) \partial^i \mathcal{A}^{aa'}{}_{a} \partial_i \mathcal{A}_{a'}{}^j + \left(-\frac{r_{\dot{3}}}{2} + r_{\dot{5}} \right) \partial_a \mathcal{A}^{aa'}{}_{i} \partial_i \mathcal{A}_{i'}{}^j +$$

$$\left(r_{\dot{3}} - 2r_{\dot{5}} \right) \partial^i \mathcal{A}^{aa'}{}_{a} \partial_i \mathcal{A}_{i'}{}^j + \frac{4}{3} r_{\dot{2}} \partial_a \mathcal{A}_{a'ij} \partial^i \mathcal{A}^{aa'}{}_{i} - \frac{2}{3} r_{\dot{2}} \partial_a \mathcal{A}_{aj'i} \partial^i \mathcal{A}^{aa'}{}_{i} +$$

$$\frac{2}{3} \left(r_{\dot{2}} - 6r_{\dot{3}} \right) \partial_a \mathcal{A}_{ij'a} \partial^i \mathcal{A}^{aa'}{}_{i} - \frac{1}{3} r_{\dot{2}} \partial_i \mathcal{A}_{aa'j} \partial^i \mathcal{A}^{aa'}{}_{i} + \frac{1}{3} r_{\dot{2}} \partial_j \mathcal{A}_{aa'i} \partial^i \mathcal{A}^{aa'}{}_{i} - \frac{2}{3} r_{\dot{2}} \partial_j \mathcal{A}_{aia'} \partial^i \mathcal{A}^{aa'}{}_{i}$$

Now we pass this theory into the PSALTer package, which computes the particle spectrum:

Gauge constraints on source currents:

Square masses:

$$\left\{ \emptyset, \left\{ -\frac{\frac{t_2}{2}}{\frac{r_2}{2}} \right\}, \emptyset, \emptyset, \emptyset, \emptyset \right\}$$

Massive pole residues:

$$\left\{ \emptyset, \left\{ -\frac{1}{\frac{r_2}{2}} \right\}, \emptyset, \emptyset, \emptyset, \emptyset \right\}$$

Massless eigenvalues:

$$\left\{ -\frac{403 r_3^2 + 172 r_3 r_5 + 28 r_5^2}{6 r_3 (2 r_3 + r_5) (r_3 + 2 r_5)}, -\frac{403 r_3^2 + 172 r_3 r_5 + 28 r_5^2}{6 r_3 (2 r_3 + r_5) (r_3 + 2 r_5)} \right\}$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ -\frac{1}{r_2}, 0^-, -\frac{t_2}{r_2} \right\}, \left\{ -\frac{403 r_3^2 + 172 r_3 r_5 + 28 r_5^2}{6 r_3 (2 r_3 + r_5) (r_3 + 2 r_5)} \right\} \right\}$$

Overall unitarity conditions:

$$\left(r_2 < 0 \&\& r_3 < 0 \&\& r_5 < -\frac{r_3}{2} \&\& t_2 > 0 \right) \parallel \left(r_2 < 0 \&\& r_3 < 0 \&\& r_5 > -2 r_3 \&\& t_2 > 0 \right) \parallel \left(r_2 < 0 \&\& r_3 > 0 \&\& -2 r_3 < r_5 < -\frac{r_3}{2} \&\& t_2 > 0 \right)$$

So, that's the end of the PSALTER output for this theory. You can check the particle content against TABLE IV. in arXiv:1910.14197. If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$\left(r_2 < 0 \&\& r_3 < 0 \&\& r_5 < -\frac{r_3}{2} \&\& t_2 > 0 \right) \parallel \left(r_2 < 0 \&\& r_3 < 0 \&\& r_5 > -2 r_3 \&\& t_2 > 0 \right) \parallel \left(r_2 < 0 \&\& r_3 > 0 \&\& -2 r_3 < r_5 < -\frac{r_3}{2} \&\& t_2 > 0 \right)$$

Okay, that concludes the analysis of this theory.

Case 3

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 3 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\frac{1}{6} r_2 \mathcal{R}_{ijhl} \mathcal{R}^{ijhl} - \frac{2}{3} r_2 \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} + r_5 \mathcal{R}_{ij}^i{}^h \mathcal{R}_{jh}^l{}^i + \frac{1}{6} r_2 \mathcal{R}^{ijhl} \mathcal{R}_{hlij} - r_5 \mathcal{R}_{ij}^i{}^h \mathcal{R}_{jh}^l{}^i + \frac{1}{4} t_1 \mathcal{T}_{ijh} \mathcal{T}^{ijh} + \frac{1}{2} t_1 \mathcal{T}^{ijh} \mathcal{T}_{jih} + \frac{1}{3} t_1 \mathcal{T}^i{}_i{}^j{}^h \mathcal{T}_{jh}^h{}_i$$

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned}
& \frac{t_1}{3} \mathcal{A}_{aia'} \mathcal{A}^{aa'i} + \frac{1}{3} \frac{t_1}{5} \mathcal{A}^{aa'a} \mathcal{A}_{a'i} - \frac{2}{3} \frac{t_1}{1} \mathcal{A}_{a'i} \partial_b f^{aa'} + \frac{2}{3} \frac{t_1}{1} \mathcal{A}_{a'i} \partial^{a'} f^a - \\
& \frac{1}{3} \frac{t_1}{1} \partial_a f^i \partial^{a'} f^a - \frac{1}{3} \frac{t_1}{1} \partial_b f^{aa'} \partial f^i_{a'} + \frac{2}{3} \frac{t_1}{1} \partial^{a'} f^a \partial f^i_{a'} + \frac{r_5}{5} \partial_a \mathcal{A}_{ij} \partial^i \mathcal{A}^{aa'} - \\
& \frac{r_5}{5} \partial_i \mathcal{A}_{a'j} \partial^i \mathcal{A}^{aa'} + 2 \frac{t_1}{1} \mathcal{A}_{a'ia} \partial^i f^{aa'} - \frac{t_1}{1} \partial_b f_{a'i} \partial^i f^{aa'} + \frac{1}{2} \frac{t_1}{1} \partial_b f_{ia} \partial^i f^{aa'} - \frac{1}{2} \frac{t_1}{1} \partial_a f_{ai} \partial^i f^{aa'} + \\
& \frac{1}{2} \frac{t_1}{1} \partial f_{aa'} \partial^i f^{aa'} + \frac{1}{2} \frac{t_1}{1} \partial f_{a'a} \partial^i f^{aa'} - \frac{r_5}{5} \partial_a \mathcal{A}^{aa'i} \partial_j \mathcal{A}_{a'i} + 2 \frac{r_5}{5} \partial^i \mathcal{A}^{aa'a} \partial_j \mathcal{A}_{a'i} + \\
& \frac{r_5}{5} \partial_a \mathcal{A}^{aa'i} \partial_j \mathcal{A}_{ia'} - 2 \frac{r_5}{5} \partial^i \mathcal{A}^{aa'a} \partial_j \mathcal{A}_{ia'} + \frac{4}{3} \frac{r_2}{2} \partial_a \mathcal{A}_{a'ij} \partial^i \mathcal{A}^{aa'i} - \frac{2}{3} \frac{r_2}{2} \partial_a \mathcal{A}_{a'ji} \partial^i \mathcal{A}^{aa'i} + \\
& \frac{2}{3} \frac{r_2}{2} \partial_a \mathcal{A}_{ija'} \partial^i \mathcal{A}^{aa'i} - \frac{1}{3} \frac{r_2}{2} \partial_i \mathcal{A}_{aa'j} \partial^i \mathcal{A}^{aa'i} + \frac{1}{3} \frac{r_2}{2} \partial_i \mathcal{A}_{aa'i} \partial^i \mathcal{A}^{aa'i} - \frac{2}{3} \frac{r_2}{2} \partial_j \mathcal{A}_{aia'} \partial^i \mathcal{A}^{aa'i}
\end{aligned}$$

Now we pass this theory into the PSALter package, which computes the particle spectrum:

The (possibly singular) a -matrices associated with the Lagrangian, as defined below Eq. (18) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \left(k^2 \frac{r_2}{2} - \frac{t_1}{1} \right), \begin{pmatrix} 0 & -\frac{ikt_1}{\sqrt{2}} & 0 \\ \frac{ikt_1}{\sqrt{2}} & \frac{1}{2} \left(2k^2 \frac{r_5}{5} - \frac{t_1}{1} \right) - \frac{t_1}{\sqrt{2}} \\ 0 & -\frac{t_1}{\sqrt{2}} & 0 \end{pmatrix} \right\},$$

Square masses:

$$\left\{ 0, \left\{ \frac{t_1}{r_2} \right\}, 0, 0, 0, 0 \right\}$$

Massive pole residues:

$$\left\{ 0, \left\{ -\frac{1}{r_2} \right\}, 0, 0, 0, 0 \right\}$$

Massless eigenvalues:

FeynArts representation of particle spectrum:

Overall unitarity conditions:

$$p \in \mathbb{R} \ \&\& \ r_2 < 0 \ \&\& \ r_5 < 0 \ \&\& \ t_1 < 0$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

Okay, that concludes the analysis of this theory.

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

Overall unitarity conditions:

$$p \in \mathbb{R} \ \&\& \ r_1 < 0 \ \&\& \ r_5 < -r_1 \ \&\& \ t_1 > 0$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$r_{\dot{1}} < 0 \ \&\& \ r_{\dot{5}} < -r_{\dot{1}} \ \&\& \ t_{\dot{1}} > 0$$

Okay, that concludes the analysis of this theory.

Case 5

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 5 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\begin{aligned} & \frac{1}{3} r_{\dot{1}} \mathcal{R}_{ijhl} \mathcal{R}^{ijhl} + \frac{2}{3} r_{\dot{1}} \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} + r_{\dot{5}} \mathcal{R}^{ijh} \mathcal{R}_{jhl} - \frac{2}{3} r_{\dot{1}} \mathcal{R}^{ijhl} \mathcal{R}_{hlij} - \\ & r_{\dot{5}} \mathcal{R}^{ijh} \mathcal{R}_{hjl} + \frac{1}{3} t_{\dot{1}} \mathcal{T}_{ijh} \mathcal{T}^{ijh} + \frac{1}{3} t_{\dot{1}} \mathcal{T}^{ijh} \mathcal{T}_{jih} + t_{\dot{1}} \mathcal{T}^{ij} \mathcal{T}_{jh} \end{aligned}$$

To use PSALTer, you have to first linearise

this Lagrangian to second order around the desired vacuum:

So, that's the end of the PSALTER output for this theory. You can check the particle content against TABLE IV. in arXiv:1910.14197. If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

Okay, that concludes the analysis of this theory.

Case 7

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 7 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\frac{1}{3}\dot{r}_1\mathcal{R}_{ijhl}\mathcal{R}^{ijhl} + \frac{2}{3}\dot{r}_1\mathcal{R}_{ihjl}\mathcal{R}^{ijhl} + (-2\dot{r}_1 + 2\dot{r}_3 + \dot{r}_5)\mathcal{R}_{ij}{}^h\mathcal{R}_j{}^l{}_{hl} + \frac{1}{3}(\dot{r}_1 - 3\dot{r}_3)\mathcal{R}^{ijhl}\mathcal{R}_{hlij} + \\ (-2\dot{r}_1 + 2\dot{r}_3 - \dot{r}_5)\mathcal{R}_{ij}{}^h\mathcal{R}_h{}^l{}_{jl} + \frac{1}{4}\dot{t}_1\mathcal{T}_{ijh}\mathcal{T}^{ijh} + \frac{1}{2}\dot{t}_1\mathcal{T}^{ijh}\mathcal{T}_{jih} + \frac{1}{3}\dot{t}_1\mathcal{T}^l{}_{ij}\mathcal{T}^h{}_{jh}$$

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned}

\end{aligned}$$

Now we pass this theory into the PSALter package, which computes the particle spectrum:

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned} & \mathbf{r}_{\mathbf{i}} \partial_{\mathbf{a}} \mathcal{A}_{\mathbf{i}}^{\mathbf{j}} \partial^{\mathbf{j}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{a}} - \mathbf{r}_{\mathbf{i}} \partial_{\mathbf{a}} \mathcal{A}_{\mathbf{a}}^{\mathbf{j}} \partial^{\mathbf{j}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{a}} - \mathbf{r}_{\mathbf{i}} \partial_{\mathbf{a}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{i}} \partial_{\mathbf{j}} \mathcal{A}_{\mathbf{a}}^{\mathbf{j}} + 2 \mathbf{r}_{\mathbf{i}} \partial^{\mathbf{j}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{a}} \partial_{\mathbf{j}} \mathcal{A}_{\mathbf{a}}^{\mathbf{j}} + \\ & \mathbf{r}_{\mathbf{i}} \partial_{\mathbf{a}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{i}} \partial_{\mathbf{j}} \mathcal{A}_{\mathbf{i}}^{\mathbf{j}} - 2 \mathbf{r}_{\mathbf{i}} \partial^{\mathbf{j}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{a}} \partial_{\mathbf{j}} \mathcal{A}_{\mathbf{i}}^{\mathbf{j}} - \frac{4}{3} \mathbf{r}_{\mathbf{i}} \partial_{\mathbf{a}} \mathcal{A}_{\mathbf{a}|\mathbf{i}|\mathbf{j}} \partial^{\mathbf{j}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{i}} + \frac{2}{3} \mathbf{r}_{\mathbf{i}} \partial_{\mathbf{a}} \mathcal{A}_{\mathbf{a}|\mathbf{j}|\mathbf{i}} \partial^{\mathbf{j}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{i}} - \\ & \frac{8}{3} \mathbf{r}_{\mathbf{i}} \partial_{\mathbf{a}} \mathcal{A}_{\mathbf{i}|\mathbf{j}|\mathbf{a}} \partial^{\mathbf{j}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{i}} - \frac{2}{3} \mathbf{r}_{\mathbf{i}} \partial_{\mathbf{j}} \mathcal{A}_{\mathbf{a}|\mathbf{a}|\mathbf{j}} \partial^{\mathbf{j}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{i}} + \frac{2}{3} \mathbf{r}_{\mathbf{i}} \partial_{\mathbf{j}} \mathcal{A}_{\mathbf{a}|\mathbf{a}|\mathbf{i}} \partial^{\mathbf{j}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{i}} + \frac{2}{3} \mathbf{r}_{\mathbf{i}} \partial_{\mathbf{j}} \mathcal{A}_{\mathbf{a}|\mathbf{i}|\mathbf{a}} \partial^{\mathbf{j}} \mathcal{A}^{\mathbf{aa}'}_{\mathbf{i}} \end{aligned}$$

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

The (possibly singular) a -matrices associated with

the Lagrangian, as defined below Eq. (18) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, (0), \begin{pmatrix} 0 & 0 & 0 \\ 0 & k^2 (2\mathbf{r}_{\mathbf{i}} + \mathbf{r}_{\mathbf{i}}) & 0 \\ 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & k^2 (\mathbf{r}_{\mathbf{i}} + \mathbf{r}_{\mathbf{i}}) & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}, (k^2 \mathbf{r}_{\mathbf{i}}) \right\}$$

Gauge constraints on source currents:

$$\begin{aligned} & \{ \mathbf{0}^+_{\mathbf{i}} \sigma^{\mathbf{b}\perp} = 0, \mathbf{0}^+_{\mathbf{i}} \sigma^{\mathbf{b}\parallel} = 0, \mathbf{0}^+_{\mathbf{i}} \tau^{\mathbf{b}\parallel} = 0, \mathbf{0}^+_{\mathbf{i}} \sigma^{\mathbf{b}\parallel} = 0, \mathbf{1}^+_{\mathbf{i}} \sigma^{\mathbf{b}\perp}{}^{\mathbf{ab}} = 0, \\ & \mathbf{1}^+_{\mathbf{i}} \tau^{\mathbf{b}\parallel}{}^{\mathbf{ab}} = 0, \mathbf{1}^-_{\mathbf{i}} \sigma^{\mathbf{b}\perp}{}^{\mathbf{a}} = 0, \mathbf{1}^-_{\mathbf{i}} \tau^{\mathbf{b}\perp}{}^{\mathbf{a}} = 0, \mathbf{1}^-_{\mathbf{i}} \tau^{\mathbf{b}\parallel}{}^{\mathbf{a}} = 0, \mathbf{2}^+_{\mathbf{i}} \sigma^{\mathbf{b}\parallel}{}^{\mathbf{ab}} = 0, \mathbf{2}^+_{\mathbf{i}} \tau^{\mathbf{b}\parallel}{}^{\mathbf{ab}} = 0 \} \end{aligned}$$

The Drazin (Moore-Penrose) inverses of these a -matrices, which are functionally

analogous to the inverse b -matrices described below Eq. (21) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, (0), \begin{pmatrix} 0 & 0 & 0 \\ 0 & \frac{1}{k^2 (2\mathbf{r}_{\mathbf{i}} + \mathbf{r}_{\mathbf{i}})} & 0 \\ 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & \frac{1}{k^2 (\mathbf{r}_{\mathbf{i}} + \mathbf{r}_{\mathbf{i}})} & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}, \left(\frac{1}{k^2 \mathbf{r}_{\mathbf{i}}} \right) \right\}$$

Square masses:

$$\{\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset\}$$

Massive pole residues:

$$\{\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset\}$$

Massless eigenvalues:

$$\left\{ \frac{-4\mathbf{r}_{\mathbf{i}}^2 - 4\mathbf{r}_{\mathbf{i}}\mathbf{r}_{\mathbf{i}} - 3\mathbf{r}_{\mathbf{i}}^2}{\mathbf{r}_{\mathbf{i}}(\mathbf{r}_{\mathbf{i}} + \mathbf{r}_{\mathbf{i}})(2\mathbf{r}_{\mathbf{i}} + \mathbf{r}_{\mathbf{i}})}, \frac{-4\mathbf{r}_{\mathbf{i}}^2 - 4\mathbf{r}_{\mathbf{i}}\mathbf{r}_{\mathbf{i}} - 3\mathbf{r}_{\mathbf{i}}^2}{\mathbf{r}_{\mathbf{i}}(\mathbf{r}_{\mathbf{i}} + \mathbf{r}_{\mathbf{i}})(2\mathbf{r}_{\mathbf{i}} + \mathbf{r}_{\mathbf{i}})} \right\}$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ \frac{-4 r_1^2 - 4 r_1 r_5 - 3 r_5^2}{r_1 (r_1 + r_5) (2 r_1 + r_5)} \right\} \right\}$$

Overall unitarity conditions:

$$\left(r_1 < 0 \ \&\& \left(r_5 < -r_1 \parallel r_5 > -2 r_1 \right) \right) \parallel \left(r_1 > 0 \ \&\& -2 r_1 < r_5 < -r_1 \right)$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in

TABLE V., and decompose them using Mathematica's Reduce function, you

get the following (to be compared with the PSALTER conditions above):

$$\left(r_1 < 0 \ \&\& \left(r_5 < -r_1 \parallel r_5 > -2 r_1 \right) \right) \parallel \left(r_1 > 0 \ \&\& -2 r_1 < r_5 < -r_1 \right)$$

Okay, that concludes the analysis of this theory.

Case 10

Now for a new theory. Here is the full nonlinear Lagrangian for

To use PSALTER, you have to first linearise

The Drazin (Moore–Penrose) inverses of these a -matrices, which are functionally analogous to the inverse b -matrices described below Eq. (21) of arXiv:1812.02675:

$$\left(\begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} \frac{1}{t} \\ \frac{t}{2} \end{pmatrix}, \begin{pmatrix} \frac{3k^2(2r_3+r_5)+2t}{(1+k^2)^2(2r_3+r_5)t} & -\frac{i\sqrt{2}}{k(1+k^2)(2r_3+r_5)} & \frac{i(3k^2(2r_3+r_5)+2t)}{k(1+k^2)^2(2r_3+r_5)t} \\ \frac{i\sqrt{2}}{k(1+k^2)(2r_3+r_5)} & \frac{1}{k^2(2r_3+r_5)} & -\frac{\sqrt{2}}{k^2(1+k^2)(2r_3+r_5)} \\ -\frac{i(3k^2(2r_3+r_5)+2t)}{k(1+k^2)^2(2r_3+r_5)t} & -\frac{\sqrt{2}}{k^2(1+k^2)(2r_3+r_5)} & \frac{3k^2(2r_3+r_5)+2t}{(k+k^3)^2(2r_3+r_5)t} \end{pmatrix}, \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & \frac{2}{k^2(r_3+2r_5)} & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & -\frac{2}{3k^2 r_3} \end{pmatrix}, (0) \right\}$$

Square masses:

$$\{\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset\}$$

Massive pole residues:

$$\{\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset\}$$

Massless eigenvalues:

$$\left\{ -\frac{45r_3^2 + 20r_3r_5 + 4r_5^2}{r_3(2r_3+r_5)(r_3+2r_5)}, -\frac{45r_3^2 + 20r_3r_5 + 4r_5^2}{r_3(2r_3+r_5)(r_3+2r_5)} \right\}$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ -\frac{45r_3^2 + 20r_3r_5 + 4r_5^2}{r_3(2r_3+r_5)(r_3+2r_5)} \right\} \right\}$$

Overall unitarity conditions:

$$\left(r_3 < 0 \ \&\& \left(r_5 < -\frac{r_3}{2} \parallel r_5 > -2r_3 \right) \right) \parallel \left(r_3 > 0 \ \&\& -2r_3 < r_5 < -\frac{r_3}{2} \right)$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$\left(r_3 < 0 \ \&\& \left(r_5 < -\frac{r_3}{2} \parallel r_5 > -2r_3 \right) \right) \parallel \left(r_3 > 0 \ \&\& -2r_3 < r_5 < -\frac{r_3}{2} \right)$$

Okay, that concludes the analysis of this theory.

Case 13

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 13 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\begin{aligned} & \frac{1}{3} \dot{r}_1 \mathcal{R}_{ijhl} \mathcal{R}^{ijhl} + \frac{2}{3} \dot{r}_1 \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} + (-2\dot{r}_1 + 2\dot{r}_3 + \dot{r}_5) \mathcal{R}^{ijh} \mathcal{R}_j{}^l{}_{hl} + \\ & \frac{1}{3} (\dot{r}_1 - 3\dot{r}_3) \mathcal{R}^{ijhl} \mathcal{R}_{hlij} + (-2\dot{r}_1 + 2\dot{r}_3 - \dot{r}_5) \mathcal{R}^{ijh} \mathcal{R}_h{}^l{}_{jl} \end{aligned}$$

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned} & (2\dot{r}_1 - 2\dot{r}_3 + \dot{r}_5) \partial_a \mathcal{A}_i{}^j \partial^j \mathcal{A}^{aa'}{}_a + (2\dot{r}_1 - 2\dot{r}_3 - \dot{r}_5) \partial_a \mathcal{A}_a{}^j \partial^j \mathcal{A}^{aa'}{}_a + \\ & (2\dot{r}_1 - 2\dot{r}_3 - \dot{r}_5) \partial_a \mathcal{A}^{aa'}{}_i \partial_b \mathcal{A}_a{}^j{}_i + (-4\dot{r}_1 + 4\dot{r}_3 + 2\dot{r}_5) \partial^j \mathcal{A}^{aa'}{}_a \partial_b \mathcal{A}_a{}^j{}_i + (2\dot{r}_1 - 2\dot{r}_3 + \dot{r}_5) \partial_a \mathcal{A}^{aa'}{}_i \partial_b \mathcal{A}_i{}^j{}_a - \\ & 2(2\dot{r}_1 - 2\dot{r}_3 + \dot{r}_5) \partial^j \mathcal{A}^{aa'}{}_a \partial_b \mathcal{A}_i{}^j{}_a - \frac{4}{3} \dot{r}_1 \partial_a \mathcal{A}_{aij} \partial^j \mathcal{A}^{aa'}{}_i + \frac{2}{3} \dot{r}_1 \partial_a \mathcal{A}_{aji} \partial^j \mathcal{A}^{aa'}{}_i + \\ & \frac{4}{3} (\dot{r}_1 - 3\dot{r}_3) \partial_a \mathcal{A}_{ija} \partial^j \mathcal{A}^{aa'}{}_i - \frac{2}{3} \dot{r}_1 \partial_a \mathcal{A}_{aa'j} \partial^j \mathcal{A}^{aa'}{}_i + \frac{2}{3} \dot{r}_1 \partial_b \mathcal{A}_{aa'i} \partial^j \mathcal{A}^{aa'}{}_i + \frac{2}{3} \dot{r}_1 \partial_b \mathcal{A}_{aia} \partial^j \mathcal{A}^{aa'}{}_i \end{aligned}$$

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

The (possibly singular) a -matrices associated with

the Lagrangian, as defined below Eq. (18) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & 6k^2(-\dot{r}_1 + \dot{r}_3) & 0 \\ 0 & 0 & 0 \end{pmatrix}, (0), \begin{pmatrix} 0 & 0 & 0 \\ 0 & k^2(2\dot{r}_3 + \dot{r}_5) & 0 \\ 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & k^2(-\dot{r}_1 + 2\dot{r}_3 + \dot{r}_5) & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}, (k^2 \dot{r}_1) \right\}$$

Gauge constraints on source currents:

$$\left\{ \begin{aligned} & \dot{\theta}^+ \tau^{\perp\perp} = 0, \dot{\theta}^+ \tau^{\parallel\parallel} = 0, \dot{\theta}^- \sigma^{\parallel\parallel} = 0, \dot{1}^+ \sigma^{\perp\perp ab} = 0, \dot{1}^+ \tau^{\parallel\parallel ab} = 0, \\ & \dot{1}^- \sigma^{\perp\perp a} = 0, \dot{1}^- \tau^{\perp\perp a} = 0, \dot{1}^- \tau^{\parallel\parallel a} = 0, \dot{2}^+ \sigma^{\parallel\parallel ab} = 0, \dot{2}^+ \tau^{\parallel\parallel ab} = 0 \end{aligned} \right\}$$

The Drazin (Moore–Penrose) inverses of these a -matrices, which are functionally

analogous to the inverse b -matrices described below Eq. (21) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & \frac{1}{6k^2(-\dot{r}_1 + \dot{r}_3)} & 0 \\ 0 & 0 & 0 \end{pmatrix}, (0), \begin{pmatrix} 0 & 0 & 0 \\ 0 & \frac{1}{k^2(2\dot{r}_3 + \dot{r}_5)} & 0 \\ 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & \frac{1}{k^2(-\dot{r}_1 + 2\dot{r}_3 + \dot{r}_5)} & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}, \left(\frac{1}{k^2 \dot{r}_1} \right) \right\}$$

Square masses:

$$\{\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset\}$$

Massive pole residues:

$$\{\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset\}$$

Massless eigenvalues:

$$\left\{ \frac{8\dot{r}_1^2 - 16\dot{r}_1\dot{r}_3 + 12\dot{r}_3^2 - 8\dot{r}_1\dot{r}_5 + 12\dot{r}_3\dot{r}_5 + 3\dot{r}_5^2}{\dot{r}_1(\dot{r}_1 - 2\dot{r}_3 - \dot{r}_5)(2\dot{r}_3 + \dot{r}_5)}, \frac{8\dot{r}_1^2 - 16\dot{r}_1\dot{r}_3 + 12\dot{r}_3^2 - 8\dot{r}_1\dot{r}_5 + 12\dot{r}_3\dot{r}_5 + 3\dot{r}_5^2}{\dot{r}_1(\dot{r}_1 - 2\dot{r}_3 - \dot{r}_5)(2\dot{r}_3 + \dot{r}_5)} \right\}$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ \frac{8r_1^2 - 16r_1 r_3 + 12r_3^2 - 8r_1 r_5 + 12r_3 r_5 + 3r_5^2}{r_1(r_1 - 2r_3 - r_5)(2r_3 + r_5)} \right\} \right\}$$

Overall unitarity conditions:

$$r_3 \in \mathbb{R} \&\& \left((r_1 < 0 \&\& (r_5 < r_1 - 2r_3 \parallel r_5 > -2r_3)) \parallel (r_1 > 0 \&\& -2r_3 < r_5 < r_1 - 2r_3) \right)$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in

Okay, that concludes the analysis of this theory.

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\left\{ \left\{ -\frac{403 r_3^2 + 172 r_3 r_5 + 28 r_5^2}{6 r_3 (2 r_3 + r_5) (r_3 + 2 r_5)} \right\} \right\}$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$\left(r_3 < 0 \ \&\& \left(r_5 < -\frac{r_3}{2} \parallel r_5 > -2 r_3 \right) \right) \parallel \left(r_3 > 0 \ \&\& -2 r_3 < r_5 < -\frac{r_3}{2} \right)$$

Okay, that concludes the analysis of this theory.

Case 16

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 16 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\begin{aligned} & \frac{1}{6} r_2 \mathcal{R}_{ijkl} \mathcal{R}^{ijkl} - \frac{2}{3} r_2 \mathcal{R}_{ihjl} \mathcal{R}^{ijkl} + \left(\frac{r_3}{2} + r_5 \right) \mathcal{R}_{ij}{}^h \mathcal{R}_j{}^l{}_{hl} + \\ & \frac{1}{6} (r_2 - 6 r_3) \mathcal{R}^{ijkl} \mathcal{R}_{hl}{}_{ij} + \frac{1}{2} (r_3 - 2 r_5) \mathcal{R}_{ij}{}^h \mathcal{R}_h{}^l{}_{jl} - \frac{2}{3} t_3 \mathcal{T}^i{}_j \mathcal{T}^j{}_i \end{aligned}$$

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

Gauge constraints on source currents:

Square masses:

$$\{\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset\}$$

Massive pole residues:

$$\{\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset\}$$

Massless eigenvalues:

$$\left\{ \frac{9t_1^2 + 2r_5 t_1 p^2 + 2r_5^2 p^4}{r_5 t_1^2}, \frac{9t_1^2 + 2r_5 t_1 p^2 + 2r_5^2 p^4}{r_5 t_1^2} \right\}$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ \frac{9 \frac{t_1}{5}^2 + 2 \frac{r_5}{5} \frac{t_1}{5} p^2 + 2 \frac{r_5}{5}^2 p^4}{\frac{r_5}{5} \frac{t_1}{5}^2} \right\} \right\}$$

Overall unitarity conditions:

$$p \in \mathbb{R} \ \&\& \ \frac{r_5}{5} > 0 \ \&\& \ \left(\frac{t_1}{5} < 0 \ \vee \ \frac{t_1}{5} > 0 \right)$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$\frac{t_1}{5} \neq 0 \ \&\& \ \frac{r_5}{5} > 0$$

Okay, that concludes the analysis of this theory.

The Drazin (Moore-Penrose) inverses of these a -matrices, which are functionally

Square masses:

$$\left\{ \emptyset, \left\{ -\frac{2}{r_2} \frac{t_1}{2} \right\}, \emptyset, \emptyset, \emptyset, \emptyset \right\}$$

Massive pole residues:

$$\left\{ \emptyset, \left\{ -\frac{1}{r_2} \right\}, \emptyset, \emptyset, \emptyset, \emptyset \right\}$$

Massless eigenvalues:

$$\emptyset$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ -\frac{1}{r_2}, \emptyset^-, -\frac{2}{r_2} \frac{t_1}{2} \right\}, \emptyset \right\}$$

Overall unitarity conditions:

$$r_2 < 0 \ \&\& \ \frac{t_1}{2} > 0$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in

TABLE V., and decompose them using Mathematica's Reduce function, you

get the following (to be compared with the PSALTER conditions above):

$$r_2 < 0 \ \&\& \ \frac{t_1}{2} > 0$$

Okay, that concludes the analysis of this theory.

Case 21

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 21 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\begin{aligned} & \frac{1}{6} \mathbf{r}_{\cdot 2} \mathcal{R}_{ijkl} \mathcal{R}^{ijkl} - \frac{2}{3} \mathbf{r}_{\cdot 2} \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} + \frac{1}{6} \mathbf{r}_{\cdot 2} \mathcal{R}^{ijhl} \mathcal{R}_{hlij} + \\ & \frac{1}{4} \mathbf{t}_{\cdot 1} \mathcal{T}_{ijh} \mathcal{T}^{ijh} + \frac{1}{2} \mathbf{t}_{\cdot 1} \mathcal{T}^{ijh} \mathcal{T}_{jih} + \frac{1}{3} \left(\mathbf{t}_{\cdot 1} - 2 \mathbf{t}_{\cdot 3} \right) \mathcal{T}^i{}_{\cdot i} \mathcal{T}^h{}_{\cdot h} \end{aligned}$$

To use PSALTer, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned} & \mathbf{t}_{\cdot 1} \mathcal{A}_{aia'} \mathcal{A}^{aa'i} + \frac{1}{3} \left(\mathbf{t}_{\cdot 1} - 2 \mathbf{t}_{\cdot 3} \right) \mathcal{A}^{aa'a} \mathcal{A}_{a'}{}^i{}_{\cdot i} - \frac{2}{3} \left(\mathbf{t}_{\cdot 1} - 2 \mathbf{t}_{\cdot 3} \right) \mathcal{A}_{a'}{}^i{}_{\cdot i} \partial_a f^{aa'} + \\ & \frac{2}{3} \left(\mathbf{t}_{\cdot 1} - 2 \mathbf{t}_{\cdot 3} \right) \mathcal{A}_{a'}{}^i{}_{\cdot i} \partial^a f^a{}_{\cdot a} + \frac{1}{3} \left(-\mathbf{t}_{\cdot 1} + 2 \mathbf{t}_{\cdot 3} \right) \partial_a f^i{}_{\cdot i} \partial^a f^a{}_{\cdot a} + \frac{1}{3} \left(-\mathbf{t}_{\cdot 1} + 2 \mathbf{t}_{\cdot 3} \right) \partial_a f^{aa'} \partial f^i{}_{\cdot a'} + \\ & \frac{2}{3} \left(\mathbf{t}_{\cdot 1} - 2 \mathbf{t}_{\cdot 3} \right) \partial^a f^a{}_{\cdot a} \partial f^i{}_{\cdot a'} + 2 \mathbf{t}_{\cdot 1} \mathcal{A}_{a'}{}^i{}_{\cdot i} \partial f^{aa'} - \mathbf{t}_{\cdot 1} \partial_a f^i{}_{\cdot i} \partial f^{aa'} + \frac{1}{2} \mathbf{t}_{\cdot 1} \partial_a f^i{}_{\cdot i} \partial f^{aa'} - \frac{1}{2} \mathbf{t}_{\cdot 1} \partial_a f^i{}_{\cdot i} \partial f^{aa'} + \\ & \frac{1}{2} \mathbf{t}_{\cdot 1} \partial_a f^{aa'} \partial f^{aa'} + \frac{1}{2} \mathbf{t}_{\cdot 1} \partial_a f^i{}_{\cdot i} \partial f^{aa'} + \frac{4}{3} \mathbf{r}_{\cdot 2} \partial_a \mathcal{A}_{a'ij} \partial \mathcal{A}^{aa'i} - \frac{2}{3} \mathbf{r}_{\cdot 2} \partial_a \mathcal{A}_{a'ij} \partial \mathcal{A}^{aa'i} + \\ & \frac{2}{3} \mathbf{r}_{\cdot 2} \partial_a \mathcal{A}_{ij} \partial \mathcal{A}^{aa'i} - \frac{1}{3} \mathbf{r}_{\cdot 2} \partial_a \mathcal{A}_{aa'} \partial \mathcal{A}^{aa'i} + \frac{1}{3} \mathbf{r}_{\cdot 2} \partial_j \mathcal{A}_{aa'i} \partial \mathcal{A}^{aa'i} - \frac{2}{3} \mathbf{r}_{\cdot 2} \partial_j \mathcal{A}_{aia'} \partial \mathcal{A}^{aa'i} \end{aligned}$$

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

The Drazin (Moore-Penrose) inverses of these a -matrices, which are functionally

analogous to the inverse b -matrices described below Eq. (21) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} \frac{2k^2}{(1+2k^2)^2 t_3} & \frac{i\sqrt{2}k}{(1+2k^2)^2 t_3} & 0 \\ -\frac{i\sqrt{2}k}{(1+2k^2)^2 t_3} & \frac{1}{(1+2k^2)^2 t_3} & 0 \\ 0 & 0 & 0 \end{pmatrix}, \left(\frac{1}{k^2 r_2 + t_2} \right), \begin{pmatrix} \frac{3k^2}{(3+k^2)^2 t_2} & \frac{3i\sqrt{2}k}{(3+k^2)^2 t_2} & \frac{3ik}{(3+k^2)^2 t_2} \\ -\frac{3i\sqrt{2}k}{(3+k^2)^2 t_2} & \frac{6}{(3+k^2)^2 t_2} & \frac{3\sqrt{2}}{(3+k^2)^2 t_2} \\ -\frac{3ik}{(3+k^2)^2 t_2} & \frac{3\sqrt{2}}{(3+k^2)^2 t_2} & \frac{3}{(3+k^2)^2 t_2} \end{pmatrix} \right\},$$

Square masses:

$$\{0, \{-\frac{t_2}{r_2}\}, 0, 0, 0, 0\}$$

Massive pole residues:

$$\{0, \{-\frac{1}{r_2}\}, 0, 0, 0, 0\}$$

Massless eigenvalues:

$$\{0\}$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ -\frac{1}{r_2}, 0^-, -\frac{t_2}{r_2} \right\}, 0 \right\}$$

Overall unitarity conditions:

$$r_2 < 0 \ \&\& \ t_2 > 0$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$r_2 < 0 \ \&\& \ t_2 > 0$$

Okay, that concludes the analysis of this theory.

Case 26

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 26 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\frac{1}{6} \mathbf{r}_{\frac{1}{2}} \mathcal{R}_{ijkl} \mathcal{R}^{ijkl} - \frac{2}{3} \mathbf{r}_{\frac{1}{2}} \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} + \frac{1}{6} \mathbf{r}_{\frac{1}{2}} \mathcal{R}^{ijkl} \mathcal{R}_{hlij} + \frac{1}{12} \mathbf{t}_{\frac{1}{2}} \mathcal{T}_{ijh} \mathcal{T}^{ijh} - \frac{1}{6} \mathbf{t}_{\frac{1}{2}} \mathcal{T}^{ijh} \mathcal{T}_{jih}$$

To use PSALTer, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned} & \frac{1}{3} \mathbf{t}_{\frac{1}{2}} \mathcal{A}_{aa'i} \mathcal{A}^{aa'i} - \frac{2}{3} \mathbf{t}_{\frac{1}{2}} \mathcal{A}_{aia'} \mathcal{A}^{aa'i} - \frac{2}{3} \mathbf{t}_{\frac{1}{2}} \mathcal{A}_{aa'i} \partial^j \mathcal{A}^{aa'i} + \frac{2}{3} \mathbf{t}_{\frac{1}{2}} \mathcal{A}_{aia'} \partial^j \mathcal{A}^{aa'i} - \\ & \frac{2}{3} \mathbf{t}_{\frac{1}{2}} \mathcal{A}_{a'ia} \partial^j \mathcal{A}^{aa'i} + \frac{1}{3} \mathbf{t}_{\frac{1}{2}} \partial_a \mathcal{A}_{a'i} \partial^j \mathcal{A}^{aa'i} - \frac{1}{6} \mathbf{t}_{\frac{1}{2}} \partial_a \mathcal{A}_{ia'} \partial^j \mathcal{A}^{aa'i} - \frac{1}{6} \mathbf{t}_{\frac{1}{2}} \partial_a \mathcal{A}_{a'i} \partial^j \mathcal{A}^{aa'i} + \\ & \frac{1}{6} \mathbf{t}_{\frac{1}{2}} \partial^j \mathcal{A}_{aa'} \partial^j \mathcal{A}^{aa'i} - \frac{1}{6} \mathbf{t}_{\frac{1}{2}} \partial^j \mathcal{A}_{a'a} \partial^j \mathcal{A}^{aa'i} + \frac{4}{3} \mathbf{r}_{\frac{1}{2}} \partial_a \mathcal{A}_{a'ij} \partial^j \mathcal{A}^{aa'i} - \frac{2}{3} \mathbf{r}_{\frac{1}{2}} \partial_a \mathcal{A}_{a'ji} \partial^j \mathcal{A}^{aa'i} + \\ & \frac{2}{3} \mathbf{r}_{\frac{1}{2}} \partial_a \mathcal{A}_{ij'a} \partial^j \mathcal{A}^{aa'i} - \frac{1}{3} \mathbf{r}_{\frac{1}{2}} \partial_i \mathcal{A}_{aa'j} \partial^j \mathcal{A}^{aa'i} + \frac{1}{3} \mathbf{r}_{\frac{1}{2}} \partial_j \mathcal{A}_{aa'i} \partial^j \mathcal{A}^{aa'i} - \frac{2}{3} \mathbf{r}_{\frac{1}{2}} \partial_j \mathcal{A}_{aia'} \partial^j \mathcal{A}^{aa'i} \end{aligned}$$

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

The Drazin (Moore-Penrose) inverses of these a -matrices, which are functionally

$$\left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \left(\frac{1}{k^2 \mathbf{r}_{\frac{1}{2}} + \mathbf{t}_{\frac{1}{2}}} \right), \begin{pmatrix} \frac{3 k^2 \mathbf{r}_{\frac{1}{5}} + 2 \mathbf{t}_{\frac{1}{2}}}{(1+k^2)^2 \mathbf{r}_{\frac{1}{5}} \mathbf{t}_{\frac{1}{2}}} & -\frac{i \sqrt{2}}{k \mathbf{r}_{\frac{1}{5}} + k^3 \mathbf{r}_{\frac{1}{5}}} & \frac{i (3 k^2 \mathbf{r}_{\frac{1}{5}} + 2 \mathbf{t}_{\frac{1}{2}})}{k (1+k^2)^2 \mathbf{r}_{\frac{1}{5}} \mathbf{t}_{\frac{1}{2}}} \\ \frac{i \sqrt{2}}{k \mathbf{r}_{\frac{1}{5}} + k^3 \mathbf{r}_{\frac{1}{5}}} & \frac{1}{k^2 \mathbf{r}_{\frac{1}{5}}} & -\frac{\sqrt{2}}{k^2 \mathbf{r}_{\frac{1}{5}} + k^4 \mathbf{r}_{\frac{1}{5}}} \\ -\frac{i (3 k^2 \mathbf{r}_{\frac{1}{5}} + 2 \mathbf{t}_{\frac{1}{2}})}{k (1+k^2)^2 \mathbf{r}_{\frac{1}{5}} \mathbf{t}_{\frac{1}{2}}} & -\frac{\sqrt{2}}{k^2 \mathbf{r}_{\frac{1}{5}} + k^4 \mathbf{r}_{\frac{1}{5}}} & \frac{3 k^2 \mathbf{r}_{\frac{1}{5}} + 2 \mathbf{t}_{\frac{1}{2}}}{(k+k^3)^2 \mathbf{r}_{\frac{1}{5}} \mathbf{t}_{\frac{1}{2}}} \end{pmatrix}, \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & \frac{1}{k^2 \mathbf{r}_{\frac{1}{5}}} & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}, (0) \right\}$$

Massless eigenvalues:

$$\{0\}$$

FeynArts representation of particle spectrum:

$$\left\{\left\{-\frac{1}{r_2}, 0^-, -\frac{t_2}{r_2}\right\}, 0\right\}$$

Overall unitarity conditions:

$$r_2 < 0 \ \&\& \ t_2 > 0$$

So, that's the end of the PSALTER output for this theory. You can check the particle content against TABLE IV. in arXiv:1910.14197. If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$r_2 < 0 \ \&\& \ t_2 > 0$$

Okay, that concludes the analysis of this theory.

Case 29

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 29 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\begin{aligned} & \frac{1}{6} \left(2r_1 + r_2 \right) \mathcal{R}_{ijhl} \mathcal{R}^{ijhl} + \frac{2}{3} \left(r_1 - r_2 \right) \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} - 2r_1 \mathcal{R}^{ijh}{}_{i} \mathcal{R}_{jhl}{}^l + \frac{1}{6} \left(-4r_1 + r_2 \right) \mathcal{R}^{ijhl} \mathcal{R}_{hlij} + \\ & 2r_1 \mathcal{R}^{ijh}{}_{i} \mathcal{R}_{hjl}{}^l + \frac{1}{12} t_2 \mathcal{T}_{ijh} \mathcal{T}^{ijh} - \frac{1}{6} t_2 \mathcal{T}^{ijh} \mathcal{T}_{jih} - \frac{2}{3} t_3 \mathcal{T}^{ij}{}_{i} \mathcal{T}^h{}_{jh} \end{aligned}$$

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned}

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned} & \frac{1}{3} t_2 \mathcal{A}_{aa'i} \mathcal{A}^{aa'i} - \frac{2}{3} t_2 \mathcal{A}_{aia'} \mathcal{A}^{aa'i} - 4 r_3 \partial_a \mathcal{A}_i{}^j{}_j \partial^i \mathcal{A}^{aa'}{}_a - \\ & \frac{2}{3} t_2 \mathcal{A}_{aa'i} \partial^i f^{aa'} + \frac{2}{3} t_2 \mathcal{A}_{aia'} \partial^i f^{aa'} - \frac{2}{3} t_2 \mathcal{A}_{a'ia} \partial^i f^{aa'} + \frac{1}{3} t_2 \partial_a f_{a'i} \partial^i f^{aa'} - \\ & \frac{1}{6} t_2 \partial_a f_{ia'} \partial^i f^{aa'} - \frac{1}{6} t_2 \partial_a f_{ai} \partial^i f^{aa'} + \frac{1}{6} t_2 \partial_i f_{aa'} \partial^i f^{aa'} - \frac{1}{6} t_2 \partial_i f_{a'a} \partial^i f^{aa'} - \\ & 4 r_3 \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_i{}^j{}_{a'} + 8 r_3 \partial^i \mathcal{A}^{aa'}{}_a \partial_i \mathcal{A}_i{}^j{}_{a'} + \frac{4}{3} r_2 \partial_a \mathcal{A}_{a'ij} \partial^i \mathcal{A}^{aa'i} - \frac{2}{3} r_2 \partial_a \mathcal{A}_{a'ji} \partial^i \mathcal{A}^{aa'i} + \\ & \frac{2}{3} \left(r_2 - 6 r_3 \right) \partial_a \mathcal{A}_{ij}{}_a \partial^i \mathcal{A}^{aa'i} - \frac{1}{3} r_2 \partial_i \mathcal{A}_{aa'j} \partial^i \mathcal{A}^{aa'i} + \frac{1}{3} r_2 \partial_i \mathcal{A}_{aa'i} \partial^i \mathcal{A}^{aa'i} - \frac{2}{3} r_2 \partial_i \mathcal{A}_{aia'} \partial^i \mathcal{A}^{aa'i} \end{aligned}$$

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

The (possibly singular) a -matrices associated with the Lagrangian, as defined below Eq. (18) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & 6k^2 r_{\frac{1}{2}} & 0 \\ 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} k^2 t_{\frac{1}{2}} & \frac{1}{3} i \sqrt{2} k t_{\frac{1}{2}} & \frac{i k t_{\frac{1}{2}}}{3} \\ -\frac{1}{3} i \sqrt{2} k t_{\frac{1}{2}} & \frac{2 t_{\frac{1}{2}}}{3} & \frac{\sqrt{2} t_{\frac{1}{2}}}{3} \\ -\frac{1}{3} i k t_{\frac{1}{2}} & \frac{\sqrt{2} t_{\frac{1}{2}}}{3} & \frac{t_{\frac{1}{2}}}{3} \end{pmatrix}, \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 \end{pmatrix} \right\}$$

Gauge constraints on source currents:

$$\left\{ \begin{aligned} 0^+ t^{\perp\perp} &= 0, \quad 0^+ t^{\parallel\parallel} = 0, \quad -i 1^+ t^{\parallel\parallel}{}^{ab} = k 1^+ \sigma^{\perp\perp}{}^{ab}, \quad -i 1^+ t^{\parallel\parallel}{}^{ab} = k 1^+ \sigma^{\parallel\parallel}{}^{ab}, \quad 1^+ \sigma^{\perp\perp}{}^a = 0, \\ 1^+ t^{\perp\perp}{}^a &= 0, \quad 1^+ \sigma^{\parallel\parallel}{}^a = 0, \quad 1^+ t^{\parallel\parallel}{}^a = 0, \quad 2^+ \sigma^{\parallel\parallel}{}^{ab} = 0, \quad 2^+ t^{\parallel\parallel}{}^{ab} = 0, \quad 2^+ \sigma^{\parallel\parallel}{}^{abc} = 0 \end{aligned} \right\}$$

The Drazin (Moore–Penrose) inverses of these a -matrices, which are functionally analogous to the inverse b -matrices described below Eq. (21) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & \frac{1}{6k^2 r_{\frac{1}{2}}} & 0 \\ 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 1 \\ k^2 r_{\frac{1}{2}} + t_{\frac{1}{2}} \end{pmatrix}, \begin{pmatrix} \frac{3k^2}{(3+k^2)^2 t_{\frac{1}{2}}} & \frac{3i\sqrt{2}k}{(3+k^2)^2 t_{\frac{1}{2}}} & \frac{3ik}{(3+k^2)^2 t_{\frac{1}{2}}} \\ -\frac{3i\sqrt{2}k}{(3+k^2)^2 t_{\frac{1}{2}}} & \frac{6}{(3+k^2)^2 t_{\frac{1}{2}}} & \frac{3\sqrt{2}}{(3+k^2)^2 t_{\frac{1}{2}}} \\ -\frac{3ik}{(3+k^2)^2 t_{\frac{1}{2}}} & \frac{3\sqrt{2}}{(3+k^2)^2 t_{\frac{1}{2}}} & \frac{3}{(3+k^2)^2 t_{\frac{1}{2}}} \end{pmatrix}, \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 \end{pmatrix} \right\}$$

Square masses:

$$\left\{ \emptyset, \left\{ -\frac{t_{\frac{1}{2}}}{r_{\frac{1}{2}}} \right\}, \emptyset, \emptyset, \emptyset, \emptyset \right\}$$

Massive pole residues:

$$\left\{ \emptyset, \left\{ -\frac{1}{r_{\frac{1}{2}}} \right\}, \emptyset, \emptyset, \emptyset, \emptyset \right\}$$

$$\emptyset$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ -\frac{1}{r_{\frac{1}{2}}}, 0^-, -\frac{t_{\frac{1}{2}}}{r_{\frac{1}{2}}} \right\}, \emptyset \right\}$$

Overall unitarity conditions:

$$r_{\frac{1}{2}} < 0 \text{ \&\& } t_{\frac{1}{2}} > 0$$

So, that's the end of the PSALTER output for this theory. You can check the particle content against TABLE IV. in arXiv:1910.14197. If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$r_{\dot{2}} < 0 \text{ \&\& } t_{\dot{2}} > 0$$

Okay, that concludes the analysis of this theory.

To use PSALTer, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned} & \frac{1}{3} \underline{t}_2 \mathcal{A}_{aa'i} \mathcal{A}^{aa'i} - \frac{2}{3} \underline{t}_2 \mathcal{A}_{aia'} \mathcal{A}^{aa'i} - 3 \underline{r}_3 \partial_{a'} \mathcal{A}_{ij} \partial^j \mathcal{A}^{aa'a} - \underline{r}_3 \partial_{a'} \mathcal{A}_{a'j} \partial^j \mathcal{A}^{aa'a} - \\ & \frac{2}{3} \underline{t}_2 \mathcal{A}_{aa'i} \partial^j \mathcal{A}^{aa'i} + \frac{2}{3} \underline{t}_2 \mathcal{A}_{aia'} \partial^j \mathcal{A}^{aa'i} - \frac{2}{3} \underline{t}_2 \mathcal{A}_{a'ia} \partial^j \mathcal{A}^{aa'i} + \frac{1}{3} \underline{t}_2 \partial_{a'} f_{a'i} \partial^j \mathcal{A}^{aa'a} - \frac{1}{6} \underline{t}_2 \partial_{a'} f_{ia'} \partial^j \mathcal{A}^{aa'a} - \\ & \frac{1}{6} \underline{t}_2 \partial_{a'} f_{a'i} \partial^j \mathcal{A}^{aa'a} + \frac{1}{6} \underline{t}_2 \partial_{a'} f_{aa'} \partial^j \mathcal{A}^{aa'i} - \frac{1}{6} \underline{t}_2 \partial_{a'} f_{a'a} \partial^j \mathcal{A}^{aa'i} - \underline{r}_3 \partial_{a'} \mathcal{A}^{aa'i} \partial_j \mathcal{A}_{a'i}^j + 2 \underline{r}_3 \partial^j \mathcal{A}^{aa'a} \partial_j \mathcal{A}_{a'i}^j - \\ & 3 \underline{r}_3 \partial_{a'} \mathcal{A}^{aa'i} \partial_j \mathcal{A}_{a'i}^j + 6 \underline{r}_3 \partial^j \mathcal{A}^{aa'a} \partial_j \mathcal{A}_{a'i}^j + \frac{4}{3} \underline{r}_2 \partial_{a'} \mathcal{A}_{a'ij} \partial^j \mathcal{A}^{aa'i} - \frac{2}{3} \underline{r}_2 \partial_{a'} \mathcal{A}_{a'ji} \partial^j \mathcal{A}^{aa'i} + \\ & \frac{2}{3} \left(\underline{r}_2 - 6 \underline{r}_3 \right) \partial_{a'} \mathcal{A}_{ij a} \partial^j \mathcal{A}^{aa'i} - \frac{1}{3} \underline{r}_2 \partial_{a'} \mathcal{A}_{aa'j} \partial^j \mathcal{A}^{aa'i} + \frac{1}{3} \underline{r}_2 \partial_{a'} \mathcal{A}_{aa'i} \partial^j \mathcal{A}^{aa'i} - \frac{2}{3} \underline{r}_2 \partial_{a'} \mathcal{A}_{aia'} \partial^j \mathcal{A}^{aa'i} \end{aligned}$$

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

The (possibly singular) a -matrices associated with

the Lagrangian, as defined below Eq. (18) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & 6k^2 \underline{r}_3 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \left(k^2 \underline{r}_2 + \underline{t}_2 \right), \begin{pmatrix} \frac{k^2 \underline{t}_2}{3} & \frac{1}{3} i \sqrt{2} k \underline{t}_2 & \frac{ik \underline{t}_2}{3} \\ -\frac{1}{3} i \sqrt{2} k \underline{t}_2 & \frac{1}{2} \left(2k^2 \underline{r}_3 + \frac{4 \underline{t}_2}{3} \right) & \frac{\sqrt{2} \underline{t}_2}{3} \\ -\frac{1}{3} i k \underline{t}_2 & \frac{\sqrt{2} \underline{t}_2}{3} & \frac{\underline{t}_2}{3} \end{pmatrix}, \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & k^2 \underline{r}_3 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}, (0) \right\}$$

Gauge constraints on source currents:

$$\left\{ \begin{aligned} & \underline{0}^+ \underline{r}^{b\perp} = 0, \underline{0}^+ \underline{r}^{b\parallel} = 0, -i \underline{1}^+ \underline{r}^{b\parallel} \sigma^{ab} = k \underline{1}^+ \sigma^{b\perp ab}, \underline{1}^+ \sigma^{b\perp a} = 0, \\ & \underline{1}^+ \underline{r}^{b\perp a} = 0, \underline{1}^+ \underline{r}^{b\parallel} = 0, \underline{2}^+ \sigma^{b\parallel ab} = 0, \underline{2}^+ \underline{r}^{b\parallel} \sigma^{ab} = 0, \underline{2}^+ \sigma^{b\parallel abc} = 0 \end{aligned} \right\}$$

The Drazin (Moore–Penrose) inverses of these a -matrices, which are functionally

analogous to the inverse b -matrices described below Eq. (21) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} 0 & 0 & 0 \\ 0 & \frac{1}{6k^2 \underline{r}_3} & 0 \\ 0 & 0 & 0 \end{pmatrix}, \left(\frac{1}{k^2 \underline{r}_2 + \underline{t}_2} \right), \begin{pmatrix} \frac{3k^2 \underline{r}_3 + 2 \underline{t}_2}{(1+k^2)^2 \underline{r}_3 \underline{t}_2} & -\frac{i \sqrt{2}}{k \underline{r}_3 + k^3 \underline{r}_3} & \frac{i(3k^2 \underline{r}_3 + 2 \underline{t}_2)}{k(1+k^2)^2 \underline{r}_3 \underline{t}_2} \\ \frac{i \sqrt{2}}{k \underline{r}_3 + k^3 \underline{r}_3} & \frac{1}{k^2 \underline{r}_3} & -\frac{\sqrt{2}}{k^2 \underline{r}_3 + k^4 \underline{r}_3} \\ -\frac{i(3k^2 \underline{r}_3 + 2 \underline{t}_2)}{k(1+k^2)^2 \underline{r}_3 \underline{t}_2} & -\frac{\sqrt{2}}{k^2 \underline{r}_3 + k^4 \underline{r}_3} & \frac{3k^2 \underline{r}_3 + 2 \underline{t}_2}{(k+k^3)^2 \underline{r}_3 \underline{t}_2} \end{pmatrix}, \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & \frac{1}{k^2 \underline{r}_3} & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}, (0) \right\}$$

Square masses:

$$\left\{ 0, \left\{ -\frac{\underline{t}_2}{\underline{r}_2} \right\}, 0, 0, 0, 0 \right\}$$

Massive pole residues:

$$\left\{ \emptyset, \left\{ -\frac{1}{r_2} \right\}, \emptyset, \emptyset, \emptyset, \emptyset \right\}$$

Massless eigenvalues:

$$\emptyset$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ -\frac{1}{r_2}, 0^-, -\frac{t_2}{r_2} \right\}, \emptyset \right\}$$

Overall unitarity conditions:

$$r_2 < 0 \ \&\& \ t_2 > 0$$

So, that's the end of the PSALTER output for this theory. You can check the particle content against TABLE IV. in arXiv:1910.14197. If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$r_2 < 0 \ \&\& \ t_2 > 0$$

Okay, that concludes the analysis of this theory.

The Drazin (Moore–Penrose) inverses of these a -matrices, which are functionally analogous to the inverse b -matrices described below Eq. (21) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} \frac{2k^2}{(1+2k^2)^2 t_3} & \frac{i\sqrt{2}k}{(1+2k^2)^2 t_3} & 0 \\ -\frac{i\sqrt{2}k}{(1+2k^2)^2 t_3} & \frac{1}{(1+2k^2)^2 t_3} & 0 \\ 0 & 0 & 0 \end{pmatrix}, \left(\frac{1}{k^2 r_2 + t_2} \right), \begin{pmatrix} \frac{3k^2}{(3+k^2)^2 t_2} & \frac{3i\sqrt{2}k}{(3+k^2)^2 t_2} & \frac{3ik}{(3+k^2)^2 t_2} \\ -\frac{3i\sqrt{2}k}{(3+k^2)^2 t_2} & \frac{6}{(3+k^2)^2 t_2} & \frac{3\sqrt{2}}{(3+k^2)^2 t_2} \\ -\frac{3ik}{(3+k^2)^2 t_2} & \frac{3\sqrt{2}}{(3+k^2)^2 t_2} & \frac{3}{(3+k^2)^2 t_2} \end{pmatrix} \right\},$$

Overall unitarity conditions:

$$r_2 < 0 \ \&\& \ t_2 > 0$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$r_2 < 0 \ \&\& \ t_2 > 0$$

Okay, that concludes the analysis of this theory.

Overall unitarity conditions:

$$r_2 < 0 \&\& r_5 < 0 \&\& t_1 < 0 \&\& 0 < t_3 < -t_1$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$r_2 < 0 \&\& r_5 < 0 \&\& t_1 < 0 \&\& 0 < t_3 < -t_1$$

Okay, that concludes the analysis of this theory.

Case 43

Now for a new theory. Here is the full nonlinear Lagrangian for

$$\frac{1}{6} r_2 \mathcal{R}_{ijhl} \mathcal{R}^{ijhl} - \frac{2}{3} r_2 \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} + r_5 \mathcal{R}^{ijh} \mathcal{R}_{jhl} + \frac{1}{6} r_2 \mathcal{R}^{ijhl} \mathcal{R}_{hlij} -$$

$$r_5 \mathcal{R}^{ijh} \mathcal{R}_{hjl} + \frac{1}{12} (4t_1 + t_2) \mathcal{T}_{ijh} \mathcal{T}^{ijh} + \frac{1}{6} (2t_1 - t_2) \mathcal{T}^{ijh} \mathcal{T}_{jih} + t_1 \mathcal{T}^i{}_i \mathcal{T}^h{}_{jh}$$

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\frac{1}{3} (t_1 + t_2) \mathcal{A}_{aa'i} \mathcal{A}^{aa'i} + \frac{1}{3} (t_1 - 2t_2) \mathcal{A}_{aia'} \mathcal{A}^{aa'i} + t_1 \mathcal{A}^{aa'}{}_a \mathcal{A}_{a'}{}^i{}_i - 2t_1 \mathcal{A}_{a'}{}^i{}_i \partial_a f^{aa'} +$$

$$\frac{1}{6} (4t_1 + t_2) \partial_a f_{aa'} \partial^i f^{aa'} + \frac{1}{6} (2t_1 - t_2) \partial_a f_{a'a} \partial^i f^{aa'} - r_5 \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_{a'}{}^j{}_j + 2r_5 \partial^i \mathcal{A}^{aa'}{}_a \partial_i \mathcal{A}_{a'}{}^j{}_j +$$

$$r_5 \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_{a'}{}^j{}_{a'} - 2r_5 \partial^i \mathcal{A}^{aa'}{}_a \partial_i \mathcal{A}_{a'}{}^j{}_{a'} + \frac{4}{3} r_2 \partial_a \mathcal{A}_{a'ij} \partial^i \mathcal{A}^{aa'i} - \frac{2}{3} r_2 \partial_a \mathcal{A}_{a'ji} \partial^i \mathcal{A}^{aa'i} +$$

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

So, that's the end of the PSALTER output for this theory. You can check the particle content against TABLE IV. in arXiv:1910.14197. If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$\left(r_1 < 0 \&\& r_5 < -r_1 \&\& t_1 > 0 \&\& t_3 < -t_1 \right) \vee \left(r_1 < 0 \&\& r_5 < -r_1 \&\& t_1 > 0 \&\& t_3 > 0 \right)$$

Okay, that concludes the analysis of this theory.

Case 45

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 45 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\begin{aligned} & \frac{1}{3} r_1 \mathcal{R}_{ijhl} \mathcal{R}^{ijhl} + \frac{2}{3} r_1 \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} + r_5 \mathcal{R}_{ij}{}^h \mathcal{R}_{jh}{}^l - \frac{2}{3} r_1 \mathcal{R}^{ijhl} \mathcal{R}_{hlij} - \\ & r_5 \mathcal{R}^{ij}{}^h \mathcal{R}_{jh}{}^l + \frac{1}{12} (4t_1 + t_2) \mathcal{T}_{ijh} \mathcal{T}^{ijh} + \frac{1}{6} (2t_1 - t_2) \mathcal{T}^{ijh} \mathcal{T}_{jih} + t_1 \mathcal{T}^i{}_i \mathcal{T}^h{}_h \end{aligned}$$

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned} & \frac{1}{3} (t_1 + t_2) \mathcal{A}_{aa'i} \mathcal{A}^{aa'i} + \frac{1}{3} (t_1 - 2t_2) \mathcal{A}_{aia'} \mathcal{A}^{aa'i} + t_1 \mathcal{A}^{aa'}{}_a \mathcal{A}_{a'}{}^i - 2t_1 \mathcal{A}_{a'}{}^i \partial_a f^{aa'} + \\ & 2t_1 \mathcal{A}_{a'}{}^i \partial_a f^a{}_{a'} - t_1 \partial_a f^i{}_i \partial_a f^a{}_{a'} - t_1 \partial_a f^{aa'} \partial_a f^i{}_{a'} + 2t_1 \partial_a f^a{}_{a'} \partial_a f^i{}_{a'} + r_5 \partial_a \mathcal{A}_i{}^j \partial^i \mathcal{A}^{aa'}{}_a - \\ & r_5 \partial_a \mathcal{A}_{a'}{}^j \partial^i \mathcal{A}^{aa'}{}_a - \frac{2}{3} (t_1 + t_2) \mathcal{A}_{aa'i} \partial^i f^{aa'} + \frac{2}{3} (t_1 + t_2) \mathcal{A}_{aia'} \partial^i f^{aa'} + \frac{2}{3} (2t_1 - t_2) \mathcal{A}_{a'}{}^i \partial^i f^{aa'} + \\ & \frac{1}{3} (-2t_1 + t_2) \partial_a f_{a'}{}^i \partial^i f^{aa'} + \frac{1}{6} (2t_1 - t_2) \partial_a f_{ia'} \partial^i f^{aa'} + \frac{1}{6} (-4t_1 - t_2) \partial_a f_{ai} \partial^i f^{aa'} + \\ & \frac{1}{6} (4t_1 + t_2) \partial_a f_{aa'} \partial^i f^{aa'} + \frac{1}{6} (2t_1 - t_2) \partial_a f_{a'}{}^i \partial^i f^{aa'} - r_5 \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_{a'}{}^j + 2r_5 \partial^i \mathcal{A}^{aa'}{}_a \partial_i \mathcal{A}_{a'}{}^j + \\ & r_5 \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_i{}^j - 2r_5 \partial^i \mathcal{A}^{aa'}{}_a \partial_i \mathcal{A}_i{}^j - \frac{4}{3} r_1 \partial_a \mathcal{A}_{a'ij} \partial^i \mathcal{A}^{aa'i} + \frac{2}{3} r_1 \partial_a \mathcal{A}_{a'ji} \partial^i \mathcal{A}^{aa'i} - \\ & \frac{8}{3} r_1 \partial_a \mathcal{A}_{ija} \partial^i \mathcal{A}^{aa'i} - \frac{2}{3} r_1 \partial_i \mathcal{A}_{aa'j} \partial^i \mathcal{A}^{aa'i} + \frac{2}{3} r_1 \partial_j \mathcal{A}_{aa'i} \partial^i \mathcal{A}^{aa'i} + \frac{2}{3} r_1 \partial_j \mathcal{A}_{aia'} \partial^i \mathcal{A}^{aa'i} \end{aligned}$$

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

Gauge constraints on source currents:

$$\left\{ \underline{0}^+ \tau^{\perp\perp} = 0, -i \underline{0}^+ \tau^{\parallel\parallel} = 2k \underline{0}^+ \sigma^{\parallel\parallel}, -i \underline{1}^+ \tau^{\parallel\parallel}{}^{ab} = k \underline{1}^+ \sigma^{\perp\perp}{}^{ab}, i \underline{1}^+ \tau^{\parallel\parallel}{}^a = 2k \underline{1}^+ \sigma^{\perp\perp}{}^a, \underline{1}^+ \tau^{\perp\perp} = 0, -i \underline{2}^+ \tau^{\parallel\parallel}{}^{ab} = 2k \underline{2}^+ \sigma^{\parallel\parallel}{}^{ab} \right\}$$

The Drazin (Moore–Penrose) inverses of these a -matrices, which are functionally

$$\left(\begin{array}{ccc} -\frac{2k^2}{(1+2k^2)^2 t_1} & -\frac{i\sqrt{2}k}{(1+2k^2)^2 t_1} & 0 \\ \frac{i\sqrt{2}k}{(1+2k^2)^2 t_1} & -\frac{1}{(1+2k^2)^2 t_1} & 0 \\ 0 & 0 & 0 \end{array} \right), \left(\frac{1}{k^2 r_2 t_2} \right), \left(\begin{array}{ccc} \frac{k^2(t_1+4t_2)}{3(1+k^2)^2 t_1 t_2} & \frac{i\sqrt{2}k(t_1-2t_2)}{3(1+k^2)^2 t_1 t_2} & \frac{ik(t_1+4t_2)}{3(1+k^2)^2 t_1 t_2} \\ -\frac{i\sqrt{2}k(t_1-2t_2)}{3(1+k^2)^2 t_1 t_2} & \frac{2(t_1+t_2)}{3t_1 t_2} & \frac{\sqrt{2}(t_1-2t_2)}{3(1+k^2)^2 t_1 t_2} \\ -\frac{ik(t_1+4t_2)}{3(1+k^2)^2 t_1 t_2} & \frac{\sqrt{2}(t_1-2t_2)}{3(1+k^2)^2 t_1 t_2} & \frac{t_1+4t_2}{3(1+k^2)^2 t_1 t_2} \end{array} \right),$$

$$\left(\begin{array}{ccc} \frac{2k^2(2k^2 r_1 t_1)}{(t_1+2k^2 t_1)^2} & -\frac{2ik}{t_1+2k^2 t_1} & 0 \\ \frac{2ik}{t_1+2k^2 t_1} & 0 & 0 \\ 0 & 0 & 0 \\ \frac{i\sqrt{2}k(2k^2 r_1 t_1)}{(t_1+2k^2 t_1)^2} & \frac{\sqrt{2}}{t_1+2k^2 t_1} & 0 \end{array} \right), \left(\begin{array}{cc} \frac{4k^2}{(1+2k^2)^2 t_1} & \frac{2i\sqrt{2}k}{(1+2k^2)^2 t_1} \\ -\frac{2i\sqrt{2}k}{(1+2k^2)^2 t_1} & \frac{2}{(1+2k^2)^2 t_1} \end{array} \right), \left(\frac{2}{2k^2 r_1 t_1} \right)$$

Square masses:

$$\left\{ \emptyset, \left\{ -\frac{t_2}{r_2} \right\}, \emptyset, \emptyset, \emptyset, \left\{ -\frac{t_1}{2r_1} \right\} \right\}$$

Massive pole residues:

$$\left\{ \emptyset, \left\{ -\frac{1}{r_2} \right\}, \emptyset, \emptyset, \emptyset, \left\{ -\frac{1}{r_1} \right\} \right\}$$

Massless eigenvalues:

$$\emptyset$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ -\frac{1}{r_2}, 0^-, -\frac{t_2}{r_2} \right\}, \left\{ -\frac{1}{r_1}, 2^-, -\frac{t_1}{2r_1} \right\}, \emptyset \right\}$$

Overall unitarity conditions:

$$r_1 < 0 \ \&\& \ r_2 < 0 \ \&\& \ t_1 > 0 \ \&\& \ t_2 > 0$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$r_1 < 0 \ \&\& \ r_2 < 0 \ \&\& \ t_1 > 0 \ \&\& \ t_2 > 0$$

Okay, that concludes the analysis of this theory.

Case 47

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 47 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$r_5 \mathcal{R}_{ij}^{ih} \mathcal{R}_{jhl} - r_5 \mathcal{R}_{ij}^{jh} \mathcal{R}_{hjl} + \frac{1}{4} t_1 \mathcal{T}_{ijh} \mathcal{T}^{ijh} + \frac{1}{2} t_1 \mathcal{T}^{ijh} \mathcal{T}_{jih} + \frac{1}{3} \left(t_1 - 2t_3 \right) \mathcal{T}^{ij} \mathcal{T}_{jh}$$

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned} & t_1 \mathcal{A}_{ia} \mathcal{A}^{aa'i} + \frac{1}{3} \left(t_1 - 2t_3 \right) \mathcal{A}^{aa'a} \mathcal{A}_{a,i} - \frac{2}{3} \left(t_1 - 2t_3 \right) \mathcal{A}_{a,i} \partial_a f^{aa'} + \\ & \frac{2}{3} \left(t_1 - 2t_3 \right) \mathcal{A}_{a,i} \partial^a f^a + \frac{1}{3} \left(-t_1 + 2t_3 \right) \partial_a f^i \partial^a f^a + \frac{1}{3} \left(-t_1 + 2t_3 \right) \partial_a f^{aa'} \partial f^i_{a'} + \\ & \frac{2}{3} \left(t_1 - 2t_3 \right) \partial^a f^a \partial f^i_{a'} + r_5 \partial_a \mathcal{A}_{ij} \partial^i \mathcal{A}^{aa'a} - r_5 \partial_a \mathcal{A}_{ij} \partial^i \mathcal{A}^{aa'a} + 2t_1 \mathcal{A}_{ia} \partial f^{aa'} - \\ & t_1 \partial_a f^i_{a'} \partial f^{aa'} + \frac{1}{2} t_1 \partial_a f^i_{a'} \partial f^{aa'} - \frac{1}{2} t_1 \partial_a f^i_{a'} \partial f^{aa'} + \frac{1}{2} t_1 \partial_a f^i_{a'} \partial f^{aa'} + \frac{1}{2} t_1 \partial_a f^i_{a'} \partial f^{aa'} - \\ & r_5 \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_{a,j} + 2r_5 \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_{a,j} + r_5 \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_{a,j} - 2r_5 \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_{a,j} \end{aligned}$$

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

The (possibly singular) a -matrices associated with

the Lagrangian, as defined below Eq. (18) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} 2k^2 t_3 & i\sqrt{2} k t_3 & 0 \\ -i\sqrt{2} k t_3 & t_3 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & -\frac{ikt_1}{\sqrt{2}} & 0 \\ \frac{ikt_1}{\sqrt{2}} & \frac{1}{2} \left(2k^2 r_5 - t_1 \right) - \frac{t_1}{\sqrt{2}} \\ 0 & -\frac{t_1}{\sqrt{2}} & 0 \end{pmatrix} \right\},$$

$$\left\{ \begin{pmatrix} \frac{2}{3} k^2 \left(t_1 + t_3 \right) & -\frac{1}{3} i k \left(t_1 - 2t_3 \right) & 0 & -\frac{1}{3} i \sqrt{2} k \left(t_1 + t_3 \right) \\ \frac{1}{3} i k \left(t_1 - 2t_3 \right) & \frac{1}{6} \left(6k^2 r_5 + t_1 + 4t_3 \right) & 0 & \frac{t_1 - 2t_3}{3\sqrt{2}} \\ 0 & 0 & 0 & 0 \\ \frac{1}{3} i \sqrt{2} k \left(t_1 + t_3 \right) & \frac{t_1 - 2t_3}{3\sqrt{2}} & 0 & \frac{t_1 + t_3}{3} \end{pmatrix}, \begin{pmatrix} k^2 t_1 & \frac{ikt_1}{\sqrt{2}} \\ -\frac{ikt_1}{\sqrt{2}} & \frac{t_1}{2} \end{pmatrix} \right\}$$

Gauge constraints on source currents:

$$\left\{ \sigma^{\perp} \tau^{\perp} = 0, -i \sigma^{\perp} \tau^{\parallel} = 2k \sigma^{\perp} \sigma^{\parallel}, -i \tau^{\perp} \tau^{\parallel} = k \sigma^{\perp} \sigma^{\perp}, i \tau^{\perp} \tau^{\parallel} = 2k \sigma^{\perp} \sigma^{\perp}, \tau^{\perp} \tau^{\perp} = 0, -i \tau^{\perp} \tau^{\parallel} = 2k \sigma^{\perp} \sigma^{\parallel} \right\}$$

The Drazin (Moore-Penrose) inverses of these a -matrices, which are functionally

$$\left. \begin{pmatrix} \frac{2k^2(6k^2 r_5 + t_1 + 4t_3)}{(1+2k^2)^2(3t_1 t_3 + 2k^2 r_5(t_1 + t_3))} & \frac{2ik(t_1 - 2t_3)}{(1+2k^2)(3t_1 t_3 + 2k^2 r_5(t_1 + t_3))} & 0 - \frac{i\sqrt{2}k(6k^2 r_5 + t_1 + 4t_3)}{(1+2k^2)^2(3t_1 t_3 + 2k^2 r_5(t_1 + t_3))} \\ -\frac{2ik(t_1 - 2t_3)}{(1+2k^2)(3t_1 t_3 + 2k^2 r_5(t_1 + t_3))} & \frac{2(t_1 + t_3)}{3t_1 t_3 + 2k^2 r_5(t_1 + t_3)} & 0 - \frac{\sqrt{2}(t_1 - 2t_3)}{(1+2k^2)(3t_1 t_3 + 2k^2 r_5(t_1 + t_3))} \\ 0 & 0 & 0 \\ \frac{i\sqrt{2}k(6k^2 r_5 + t_1 + 4t_3)}{(1+2k^2)^2(3t_1 t_3 + 2k^2 r_5(t_1 + t_3))} & -\frac{\sqrt{2}(t_1 - 2t_3)}{(1+2k^2)(3t_1 t_3 + 2k^2 r_5(t_1 + t_3))} & 0 - \frac{6k^2 r_5 + t_1 + 4t_3}{(1+2k^2)^2(3t_1 t_3 + 2k^2 r_5(t_1 + t_3))} \end{pmatrix}, \begin{pmatrix} \frac{4k^2}{(1+2k^2)^2} & \frac{2i\sqrt{2}k}{(1+2k^2)^2} \\ -\frac{2i\sqrt{2}k}{(1+2k^2)^2} & \frac{2}{(1+2k^2)^2} \end{pmatrix}, \begin{pmatrix} \frac{2}{t_1} \end{pmatrix} \right\}$$

Square masses:

$$\{\emptyset, \emptyset, \emptyset, \left\{ -\frac{3t_1 t_3}{2r_5 t_1 + 2r_5 t_3} \right\}, \emptyset, \emptyset\}$$

Massive pole residues:

$$\{\emptyset, \emptyset, \emptyset, \left\{ \frac{6t_1 t_3(t_1 + t_3) - 3r_5(t_1^2 + 2t_3^2)}{2r_5(t_1 + t_3)(-3t_1 t_3 + r_5(t_1 + t_3))} \right\}, \emptyset, \emptyset\}$$

Massless eigenvalues:

\emptyset

FeynArts representation of particle spectrum:

$$\left\{ \left\{ \frac{6t_1 t_3(t_1 + t_3) - 3r_5(t_1^2 + 2t_3^2)}{2r_5(t_1 + t_3)(-3t_1 t_3 + r_5(t_1 + t_3))}, 1^-, -\frac{3t_1 t_3}{2r_5 t_1 + 2r_5 t_3} \right\}, \emptyset \right\}$$

Overall unitarity conditions:

$$r_5 < 0 \ \&\& \left(\left(t_1 < 0 \ \&\& 0 < t_3 < -t_1 \right) \parallel \left(t_1 > 0 \ \&\& \left(t_3 < -t_1 \parallel t_3 > 0 \right) \right) \right)$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in

TABLE V., and decompose them using Mathematica's Reduce function, you

get the following (to be compared with the PSALTER conditions above):

$$\left(r_5 < 0 \ \&\& t_1 < 0 \ \&\& 0 < t_3 < -t_1 \right) \parallel \left(r_5 < 0 \ \&\& t_1 > 0 \ \&\& t_3 < -t_1 \parallel \left(r_5 < 0 \ \&\& t_1 > 0 \ \&\& t_3 > 0 \right) \right)$$

Okay, that concludes the analysis of this theory.

Case 48

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 48 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$r_5 \mathcal{R}_{ij}^{ih} \mathcal{R}_{jhl} - r_5 \mathcal{R}_{ij}^{jh} \mathcal{R}_{hjl} + \frac{1}{12} (4t_1 + t_2) \mathcal{T}_{ijh} \mathcal{T}^{ijh} + \frac{1}{6} (2t_1 - t_2) \mathcal{T}^{ijh} \mathcal{T}_{jih} + t_1 \mathcal{T}^i{}_i{}^j{}_j \mathcal{T}^h{}_{jh}$$

To use PSALTer, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned} & \frac{1}{3} (t_1 + t_2) \mathcal{A}_{aa'i} \mathcal{A}^{aa'i} + \frac{1}{3} (t_1 - 2t_2) \mathcal{A}_{aia'} \mathcal{A}^{aa'i} + t_1 \mathcal{A}^{aa'}{}_a \mathcal{A}_{a'}{}^i{}_i - \\ & 2t_1 \mathcal{A}_{a'}{}^i{}_i \partial_a f^{aa'} + 2t_1 \mathcal{A}_{a'}{}^i{}_i \partial^a f_a{}^a - t_1 \partial_a f_a{}^i \partial^a f_a{}^a - t_1 \partial_a f^{aa'} \partial_a f_a{}^i + 2t_1 \partial^a f_a{}^a \partial_a f_a{}^i + \\ & r_5 \partial_a \mathcal{A}_i{}^j \partial^i \mathcal{A}^{aa'}{}_a - r_5 \partial_a \mathcal{A}_i{}^j \partial^i \mathcal{A}^{aa'}{}_a - \frac{2}{3} (t_1 + t_2) \mathcal{A}_{aa'i} \partial^i f^{aa'} + \frac{2}{3} (t_1 + t_2) \mathcal{A}_{aia'} \partial^i f^{aa'} + \\ & \frac{2}{3} (2t_1 - t_2) \mathcal{A}_{a'}{}^i{}_i \partial^i f^{aa'} + \frac{1}{3} (-2t_1 + t_2) \partial_a f_a{}^i \partial^i f^{aa'} + \frac{1}{6} (2t_1 - t_2) \partial_a f_{ia'} \partial^i f^{aa'} + \\ & \frac{1}{6} (-4t_1 - t_2) \partial_a f_a{}^i \partial^i f^{aa'} + \frac{1}{6} (4t_1 + t_2) \partial_a f_{aa'} \partial^i f^{aa'} + \frac{1}{6} (2t_1 - t_2) \partial_a f_a{}^a \partial^i f^{aa'} - \\ & r_5 \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_{a'}{}^j{}_i + 2r_5 \partial^i \mathcal{A}^{aa'}{}_a \partial_i \mathcal{A}_{a'}{}^j{}_i + r_5 \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_i{}^j{}_a - 2r_5 \partial^i \mathcal{A}^{aa'}{}_a \partial_i \mathcal{A}_i{}^j{}_a, \end{aligned}$$

Now we pass this theory into the PSALTer package, which computes the particle spectrum:

$$\left\{ \left\{ \frac{-3t_1 t_2(t_1 + t_2) + 3r_5(t_1^2 + 2t_2^2)}{r_5(t_1 + t_2)(-3t_1 t_2 + 2r_5(t_1 + t_2))}, 1^+, -\frac{3t_1 t_2}{2r_5 t_1 + 2r_5 t_2} \right\}, \emptyset \right\}$$

Overall unitarity conditions:

$$r_5 > 0 \ \&\& \left((t_1 < 0 \ \&\& (t_2 < 0 \parallel t_2 > -t_1)) \parallel (t_1 > 0 \ \&\& -t_1 < t_2 < 0) \right)$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$r_5 > 0 \ \&\& \left((t_1 < 0 \ \&\& (t_2 < 0 \parallel t_2 > -t_1)) \parallel (t_1 > 0 \ \&\& -t_1 < t_2 < 0) \right)$$

Okay, that concludes the analysis of this theory.

Case 49

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 49 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\begin{aligned} & \frac{1}{6} \mathbf{r}_{\frac{1}{2}} \mathcal{R}_{ijhl} \mathcal{R}^{ijhl} - \frac{2}{3} \mathbf{r}_{\frac{1}{2}} \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} + \mathbf{r}_{\frac{1}{5}} \mathcal{R}^{ijh} \mathcal{R}_{jhl} + \frac{1}{6} \mathbf{r}_{\frac{1}{2}} \mathcal{R}^{ijhl} \mathcal{R}_{hl ij} - \\ & \mathbf{r}_{\frac{1}{5}} \mathcal{R}^{ijh} \mathcal{R}_{hjl} + \frac{1}{4} \mathbf{t}_{\frac{1}{1}} \mathcal{T}_{ijh} \mathcal{T}^{ijh} + \frac{1}{2} \mathbf{t}_{\frac{1}{1}} \mathcal{T}^{ijh} \mathcal{T}_{jih} + \mathbf{t}_{\frac{1}{1}} \mathcal{T}^{ij} \mathcal{T}_{jh} \end{aligned}$$

To use PSALTER, you have to first linearise

this Lagrangian to second order around the desired vacuum:

$$\begin{aligned} & \mathbf{t}_{\frac{1}{1}} \mathcal{A}_{ai} \mathcal{A}^{aa'i} + \mathbf{t}_{\frac{1}{1}} \mathcal{A}^{aa'} \mathcal{A}_{a'i} - 2 \mathbf{t}_{\frac{1}{1}} \mathcal{A}_{a'i} \partial_a \mathcal{A}^{aa'} + 2 \mathbf{t}_{\frac{1}{1}} \mathcal{A}_{a'i} \partial^a \mathcal{A}^{aa'} - \\ & \mathbf{t}_{\frac{1}{1}} \partial_a \mathcal{A}^i \partial^a \mathcal{A}^{aa'} - \mathbf{t}_{\frac{1}{1}} \partial_a \mathcal{A}^{aa'} \partial \mathcal{A}^i_a + 2 \mathbf{t}_{\frac{1}{1}} \partial^a \mathcal{A}^a \partial \mathcal{A}^i_a + \mathbf{r}_{\frac{1}{5}} \partial_a \mathcal{A}^j \partial^i \mathcal{A}^{aa'} - \mathbf{r}_{\frac{1}{5}} \partial_i \mathcal{A}_{a'}^j \partial^i \mathcal{A}^{aa'}_a + \\ & 2 \mathbf{t}_{\frac{1}{1}} \mathcal{A}_{a'i} \partial \mathcal{A}^{aa'} - \mathbf{t}_{\frac{1}{1}} \partial_a \mathcal{A}_{a'i} \partial \mathcal{A}^{aa'} + \frac{1}{2} \mathbf{t}_{\frac{1}{1}} \partial_a \mathcal{A}_{a'i} \partial \mathcal{A}^{aa'} - \frac{1}{2} \mathbf{t}_{\frac{1}{1}} \partial_a \mathcal{A}_{a'i} \partial \mathcal{A}^{aa'} + \\ & \frac{1}{2} \mathbf{t}_{\frac{1}{1}} \partial \mathcal{A}_{aa'} \partial \mathcal{A}^{aa'} + \frac{1}{2} \mathbf{t}_{\frac{1}{1}} \partial \mathcal{A}_{a'a} \partial \mathcal{A}^{aa'} - \mathbf{r}_{\frac{1}{5}} \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_{a'}^j + 2 \mathbf{r}_{\frac{1}{5}} \partial^i \mathcal{A}^{aa'}_a \partial_i \mathcal{A}_{a'}^j + \\ & \mathbf{r}_{\frac{1}{5}} \partial_a \mathcal{A}^{aa'i} \partial_i \mathcal{A}_{a'}^j - 2 \mathbf{r}_{\frac{1}{5}} \partial^i \mathcal{A}^{aa'}_a \partial_i \mathcal{A}_{a'}^j + \frac{4}{3} \mathbf{r}_{\frac{1}{2}} \partial_a \mathcal{A}_{aij} \partial^i \mathcal{A}^{aa'i} - \frac{2}{3} \mathbf{r}_{\frac{1}{2}} \partial_a \mathcal{A}_{aji} \partial^i \mathcal{A}^{aa'i} + \\ & \frac{2}{3} \mathbf{r}_{\frac{1}{2}} \partial_a \mathcal{A}_{ija} \partial^i \mathcal{A}^{aa'i} - \frac{1}{3} \mathbf{r}_{\frac{1}{2}} \partial_i \mathcal{A}_{aa'j} \partial^i \mathcal{A}^{aa'i} + \frac{1}{3} \mathbf{r}_{\frac{1}{2}} \partial_i \mathcal{A}_{aa'i} \partial^i \mathcal{A}^{aa'i} - \frac{2}{3} \mathbf{r}_{\frac{1}{2}} \partial_i \mathcal{A}_{aia} \partial^i \mathcal{A}^{aa'i} \end{aligned}$$

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

The (possibly singular) a -matrices associated with

the Lagrangian, as defined below Eq. (18) of arXiv:1812.02675:

$$\left\{ \begin{pmatrix} -2k^2 \mathbf{t}_{\frac{1}{1}} & -i\sqrt{2} k \mathbf{t}_{\frac{1}{1}} & 0 \\ i\sqrt{2} k \mathbf{t}_{\frac{1}{1}} & -\mathbf{t}_{\frac{1}{1}} & 0 \\ 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} k^2 \mathbf{r}_{\frac{1}{2}} & -\mathbf{t}_{\frac{1}{1}} \end{pmatrix}, \right. \\ \left. \begin{pmatrix} 0 & -\frac{i k \mathbf{t}_{\frac{1}{1}}}{\sqrt{2}} & 0 \\ \frac{i k \mathbf{t}_{\frac{1}{1}}}{\sqrt{2}} & \frac{1}{2} \left(2k^2 \mathbf{r}_{\frac{1}{5}} - \mathbf{t}_{\frac{1}{1}} \right) - \frac{\mathbf{t}_{\frac{1}{1}}}{\sqrt{2}} \\ 0 & -\frac{\mathbf{t}_{\frac{1}{1}}}{\sqrt{2}} & 0 \end{pmatrix}, \begin{pmatrix} 0 & -i k \mathbf{t}_{\frac{1}{1}} & 0 & 0 \\ i k \mathbf{t}_{\frac{1}{1}} & k^2 \mathbf{r}_{\frac{1}{5}} - \frac{\mathbf{t}_{\frac{1}{1}}}{2} & 0 & \frac{\mathbf{t}_{\frac{1}{1}}}{\sqrt{2}} \\ 0 & 0 & 0 & 0 \\ 0 & \frac{\mathbf{t}_{\frac{1}{1}}}{\sqrt{2}} & 0 & 0 \end{pmatrix}, \begin{pmatrix} k^2 \mathbf{t}_{\frac{1}{1}} & \frac{i k \mathbf{t}_{\frac{1}{1}}}{\sqrt{2}} \\ -\frac{i k \mathbf{t}_{\frac{1}{1}}}{\sqrt{2}} & \frac{\mathbf{t}_{\frac{1}{1}}}{2} \end{pmatrix}, \begin{pmatrix} \mathbf{t}_{\frac{1}{1}} \\ \frac{\mathbf{t}_{\frac{1}{1}}}{2} \end{pmatrix} \right\}$$

Gauge constraints on source currents:

The Drazin (Moore-Penrose) inverses of these a -matrices, which are functionally

Square masses:

$$\{\emptyset, \left\{ \frac{t_1}{r_2} \right\}, \emptyset, \emptyset, \emptyset, \emptyset\}$$

Massive pole residues:

So, that's the end of the PSALTER output for this theory. You

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

Now we pass this theory into the PSALTER package, which computes the particle spectrum:

Gauge constraints on source currents:

$$\left\{ \begin{pmatrix} -\frac{2k^2}{(1+2k^2)^2 t_1} & -\frac{i\sqrt{2}k}{(1+2k^2)^2 t_1} & 0 \\ \frac{i\sqrt{2}k}{(1+2k^2)^2 t_1} & -\frac{1}{(1+2k^2)^2 t_1} & 0 \\ 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} \frac{1}{t_2} \end{pmatrix}, \begin{pmatrix} \frac{k^2(t_1+4t_2)}{3(1+k^2)^2 t_1 t_2} & \frac{i\sqrt{2}k(t_1-2t_2)}{3(1+k^2)^2 t_1 t_2} & \frac{ik(t_1+4t_2)}{3(1+k^2)^2 t_1 t_2} \\ -\frac{i\sqrt{2}k(t_1-2t_2)}{3(1+k^2)^2 t_1 t_2} & \frac{2(t_1+t_2)}{3t_1 t_2} & \frac{\sqrt{2}(t_1-2t_2)}{3(1+k^2)^2 t_1 t_2} \\ -\frac{ik(t_1+4t_2)}{3(1+k^2)^2 t_1 t_2} & \frac{\sqrt{2}(t_1-2t_2)}{3(1+k^2)^2 t_1 t_2} & \frac{t_1+4t_2}{3(1+k^2)^2 t_1 t_2} \end{pmatrix}, \right.$$

$$\left. \begin{pmatrix} \frac{2k^2(2k^2 r_1 + t_1)}{(t_1+2k^2 t_1)^2} & -\frac{2ik}{t_1+2k^2 t_1} & 0 & -\frac{i\sqrt{2}k(2k^2 r_1 + t_1)}{(t_1+2k^2 t_1)^2} \\ \frac{2ik}{t_1+2k^2 t_1} & 0 & 0 & \frac{\sqrt{2}}{t_1+2k^2 t_1} \\ 0 & 0 & 0 & 0 \\ \frac{i\sqrt{2}k(2k^2 r_1 + t_1)}{(t_1+2k^2 t_1)^2} & \frac{\sqrt{2}}{t_1+2k^2 t_1} & 0 & \frac{2k^2 r_1 + t_1}{(t_1+2k^2 t_1)^2} \end{pmatrix}, \begin{pmatrix} \frac{4k^2}{(1+2k^2)^2 t_1} & \frac{2i\sqrt{2}k}{(1+2k^2)^2 t_1} \\ -\frac{2i\sqrt{2}k}{(1+2k^2)^2 t_1} & \frac{2}{(1+2k^2)^2 t_1} \end{pmatrix}, \left\{ \frac{2}{2k^2 r_1 + t_1} \right\} \right\}$$

Square masses:

$$\{\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \left\{ -\frac{t_1}{2r_1} \right\}\}$$

Massive pole residues:

$$\{\emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \emptyset, \left\{ -\frac{1}{r_1} \right\}\}$$

Massless eigenvalues:

$$\{\emptyset\}$$

FeynArts representation of particle spectrum:

$$\left\{ \left\{ -\frac{1}{r_1}, 2^-, -\frac{t_1}{2r_1} \right\}, \emptyset \right\}$$

Overall unitarity conditions:

$$r_1 < 0 \ \&\& \ t_1 > 0$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in

TABLE V., and decompose them using Mathematica's Reduce function, you

get the following (to be compared with the PSALTER conditions above):

$$r_1 < 0 \ \&\& \ t_1 > 0$$

Okay, that concludes the analysis of this theory.

Case 52

Now for a new theory. Here is the full nonlinear Lagrangian for

Overall unitarity conditions:

$$r_1 < 0 \ \&\& \ t_1 > 0$$

So, that's the end of the PSALTER output for this theory. You

can check the particle content against TABLE IV. in arXiv:1910.14197.

If you take the overall unitarity conditions from the final column in TABLE V., and decompose them using Mathematica's Reduce function, you get the following (to be compared with the PSALTER conditions above):

$$r_1 < 0 \ \&\& \ t_1 > 0$$

Okay, that concludes the analysis of this theory.

Case 54

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 54 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\begin{aligned} & \frac{1}{3} \dot{r}_i \mathcal{R}_{ijhl} \mathcal{R}^{ijhl} + \frac{2}{3} \dot{r}_i \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} - 2 \dot{r}_i \mathcal{R}^{ijh} \mathcal{R}_{jhl} - \frac{2}{3} \dot{r}_i \mathcal{R}^{ijhl} \mathcal{R}_{hl ij} + \\ & 2 \dot{r}_i \mathcal{R}^{ijh} \mathcal{R}_{hjl} + \frac{1}{4} \dot{t}_i \mathcal{T}_{ijh} \mathcal{T}^{ijh} + \frac{1}{2} \dot{t}_i \mathcal{T}^{ijh} \mathcal{T}_{jih} + \dot{t}_i \mathcal{T}^{ij} \mathcal{T}_{jh} \end{aligned}$$

To use PSALTer, you have to first linearise

Case 57

Now for a new theory. Here is the full nonlinear Lagrangian for

Case 57 as defined by the second column of TABLE V. in arXiv:1910.14197:

$$\begin{aligned} & \frac{1}{6} (2r_1 + r_2) \mathcal{R}_{ijhl} \mathcal{R}^{ijhl} + \frac{2}{3} (r_1 - r_2) \mathcal{R}_{ihjl} \mathcal{R}^{ijhl} - 2r_1 \mathcal{R}^{ijh}{}_{i'} \mathcal{R}_{j'}{}^{l}{}_{hl} + \\ & \frac{1}{6} (-4r_1 + r_2) \mathcal{R}^{ijhl} \mathcal{R}_{hlij} + 2r_1 \mathcal{R}^{ijh}{}_{i'} \mathcal{R}_{h'jl} + \frac{1}{3} t_1 \mathcal{T}_{ijh} \mathcal{T}^{ijh} + \frac{1}{3} t_1 \mathcal{T}^{ijh} \mathcal{T}_{jih} + t_1 \mathcal{T}^i{}_{i'}{}^j \mathcal{T}^h{}_{jh} \end{aligned}$$

To use PSALter, you have to first linearise

this Lagrangian to second order around the desired vacuum:
